# INCLUSION AND NEIGHBORHOOD PROPERTIES OF A CERTAIN SUBCLASSES OF P-VALENT FUNCTIONS WITH NEGATIVE COEFFICIENTS 

R. M. El-Ashwah

#### Abstract

By means of Ruscheweyh derivative operator, we introduced and investigated two new subclasses of p-valent analytic functions. The various results obtained here for each of these function class include coefficient bounds and distortion inequalities, associated inclusion relations for the $(n, \theta)$-neighborhoods of subclasses of analytic and multivalent functions with negative coefficients, which are defined by means of non-homogenous differential equation.

## 1 Introductin

Let $T_{p}(n)$ denote the class of functions of the form:

$$
\begin{equation*}
f(z)=z^{p}-\sum_{k=n+p}^{\infty} a_{k} z^{k} \quad\left(a_{k} \geq 0 ; p, n \in N=\{1,2, \ldots .\}\right) \tag{1.1}
\end{equation*}
$$

which are analytic and p-valent in the open unit disc $U=\{z:|z|<1\}$. The modified Hadamard product (or convolution) of the function $f(z)$ given by (1.1) and the function $g(z) \in T_{p}(n)$ given by

$$
\begin{equation*}
g(z)=z^{p}-\sum_{k=n+p}^{\infty} b_{k} z^{k} \quad\left(b_{k} \geq 0 ; p, n \in N\right) \tag{1.2}
\end{equation*}
$$

is defined by

$$
\begin{equation*}
(f * g)(z)=z^{p}-\sum_{k=n+p}^{\infty} a_{k} b_{k} z^{k}=(g * f)(z) \tag{1.3}
\end{equation*}
$$

[^0]We introduce here an extended linear derivative operator of Ruscheweyh type (see [14]):

$$
D^{\mu, p}: T_{p} \rightarrow T_{p} \quad\left(T_{p}=T_{p}(1)\right)
$$

which is defined by the following convolution:

$$
\begin{equation*}
D^{\mu, p} f(z)=\frac{z^{p}}{(1-z)^{\mu+p}} * f(z) \quad\left(\mu>-p ; f(z) \in T_{p}\right) \tag{1.4}
\end{equation*}
$$

which in view of (1.1) (with $n=1$ ) becomes

$$
\begin{align*}
& D^{\mu, p} f(z)=z^{p}-\sum_{k=p+1}^{\infty}\binom{k+\mu-1}{k-p} a_{k} z^{k} \\
& \quad=z^{p}-\sum_{k=p+1}^{\infty} \frac{\Gamma(k+\mu)}{(k-p)!\Gamma(p+\mu)} a_{k} z^{k} \quad\left(\mu>-p ; f(z) \in T_{p}\right) \tag{1.5}
\end{align*}
$$

In particular, when $\mu=n\left(n \in N_{0}=N \cup\{0\}\right)$, it is easy observed from (1.4) and (1.5) that

$$
\begin{equation*}
D^{n, p} f(z)=\frac{z^{p}\left(z^{n-p} f(z)\right)^{(n)}}{n!} \quad\left(p \in N ; n \in N_{0}\right) \tag{1.6}
\end{equation*}
$$

so that

$$
\begin{equation*}
D^{1-p, p} f(z)=f(z) \quad \text { and } \quad D^{1, p} f(z)=(1-p) f(z)+z f^{\prime}(z) \tag{1.7}
\end{equation*}
$$

For a function $f(z) \in T_{p}(n)$, we have (see [9])

$$
\begin{gather*}
\left(D^{\mu, p} f(z)\right)^{(q)}=\delta(p, q) z^{p-q}-\sum_{k=n+p}^{\infty}\binom{k+\mu-1}{k-p} \delta(k, q) a_{k} z^{k-q} \\
=\delta(p, q) z^{p-q}-\sum_{k=n+p}^{\infty} \frac{\Gamma(k+\mu)}{(k-p)!\Gamma(p+\mu)} \delta(k, q) a_{k} z^{k-q} \\
\left(p \in N ; q \in N_{0} ; p>q\right) \tag{1.8}
\end{gather*}
$$

where

$$
\delta(p, q)=\left\{\begin{array}{lc}
1 & (q=0)  \tag{1.9}\\
p(p-1) \ldots \ldots \ldots . .(p-q+1) & (q \neq 0)
\end{array}\right.
$$

Now, making use of the operator $D^{\mu, p} f(z)(\mu>-p, p \in N)$ given by (1.5), we now introduce a new subclass $T_{\mu}^{q}(n, p, \lambda, \beta)$ of the p-valent analytic function class $T_{p}(n)$ which consist of functions $f(z) \in T_{p}(n)$ satisfying the inequality:

$$
\left|\left\{\frac{\lambda z\left(D^{\mu, p} f(z)\right)^{(q+1)}+(1-\lambda) z\left(D^{1+\mu, p} f(z)\right)^{(q+1)}}{\lambda\left(D^{\mu, p} f(z)\right)^{(q)}+(1-\lambda)\left(D^{1+\mu, p} f(z)\right)^{(q)}}-(p-q)\right\}\right|<\beta
$$

Inclusion and neighborhood properties of a certain subclasses of p-valent...

$$
\begin{equation*}
\left(p \in N ; q \in N_{0} ; 0 \leq \lambda \leq 1 ; p>\max (q,-\mu) ; 0<\beta \leq 1\right) \tag{1.10}
\end{equation*}
$$

We note that:
(i) $T_{\mu}^{0}(n, 1, \lambda, \beta)=T_{\mu}(n, \lambda, \beta)$ (Irmak et al. [10 ]);
(ii) $T_{0}^{0}(n, p, \lambda, \beta|b|)=S_{n}(b, \lambda, \beta)(b \in C \backslash\{0\})$ (Altintas et al. [5]);
(iii) $T_{\mu}^{0}(n, p, 1, \beta|b|)=S(b, \mu, \beta)(b \in C \backslash\{0\})$ (Murugusundaramoorthy and Srivastava [13]).

Also in this paper we shall derive several results for functions in the subclass $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$ of the function class $T_{p}(n)$, which is defined as follows:

A function $f(z) \in T_{p}(n)$ is said to belong to the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$ if $w=f(z)$ satisfies the following non-homogenous Cauchy-Euler differential equation :

$$
\begin{equation*}
z^{2} \frac{d^{2+q} w}{d z^{2+q}}+2(1+\gamma) z \frac{d^{1+q} w}{d z^{1+q}}+\gamma(1+\gamma) \frac{d^{q} w}{d z^{q}}=(p-q+\gamma)(p-q+\gamma+1) \frac{d^{q} g(z)}{d z^{q}} \tag{1.11}
\end{equation*}
$$

where $g(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$ and $\gamma>q-p, \gamma \in R$.
Several other interesting subclasses of the class $T_{p}(n)$ were investigated recently, for example, by Chen et al. [8], Chen [7], Srivastava and Aouf [16], Murugusundarmoorthy et al. [12], Altinatas [1], and Altinatas et al. ([3] and [4]), (see also Srivastava and Owa [17]).

In this paper we investigate the geometric characteristics of the classes $T_{\mu}^{q}(n, p, \lambda, \beta)$ and $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$ also we investigate some ( $\mathrm{n}, \theta$ )-neighborhood properties.

## 2 Basic properties of the class $T_{\mu}^{q}(n, p, \lambda, \beta)$

We begin by proving a necessery and sufficient condition for a function belonging to the class $T_{p}(n)$ to be in the class $T_{\mu}^{q}(n, p, \lambda, \beta)$.
Theorem 1. Let the function $f(z)$ be defined by (1.1). Then $f(z)$ is in the class $T_{\mu}^{q}(n, p, \lambda, \beta)$ if and only if

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} \frac{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!} a_{k} \leq \beta \Gamma(p+1+\mu) \delta(p, q) \tag{2.1}
\end{equation*}
$$

Proof. If the condition (2.1) holds true, we find from (1.1) and (2.1) that

$$
\begin{gathered}
\mid \lambda z\left(D^{\mu, p} f(z)\right)^{(q+1)}+(1-\lambda) z\left(D^{1+\mu, p} f(z)\right)^{(q+1)}-(p-q)\left[\lambda\left(D^{\mu, p} f(z)\right)^{(q)}-\right. \\
\left.(1-\lambda)\left(D^{1+\mu, p} f(z)\right)^{(q)}\right]|-\beta| \lambda\left(D^{\mu} f(z)\right)^{(q)}+(1-\lambda)\left(D^{1+\mu, p} f(z)\right)^{(q)} \mid \\
=\left|\sum_{k=n+p}^{\infty} \frac{(k-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!\Gamma(p+1+\mu)} a_{k} z^{k-p}\right| \\
-\beta\left|\delta(p, q)-\sum_{k=n+p}^{\infty} \frac{[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!\Gamma(p+1+\mu)} a_{k} z^{k-p}\right|
\end{gathered}
$$

$$
\begin{aligned}
& \leq \sum_{k=n+p}^{\infty} \frac{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!\Gamma(p+1+\mu)} a_{k}-\beta \delta(p, q) \\
& \leq 0 \quad(z \in \partial U=\{z: z \in C \quad \text { and } \quad|z|=1\})
\end{aligned}
$$

Hence, by the maximum modulus theorem, $f(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$.
Conversely, let $f(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$ be given by (1.1). Then, from (1.8) and (1.10), we have

$$
\begin{align*}
&\left|\frac{\lambda z\left(D^{\mu, p} f(z)\right)^{(q+1)}+(1-\lambda) z\left(D^{1+\mu, p} f(z)\right)^{(q+1)}}{\lambda\left(D^{\mu, p} f(z)\right)^{(q)}+(1-\lambda)\left(D^{1+\mu, p} f(z)\right)^{(q)}}-(p-q)\right| \\
&= \left\lvert\,-\sum_{k=n+p}^{\infty} \frac{(k-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!\Gamma(p+1+\mu)} a_{k} z^{k-p}\right.  \tag{2.2}\\
& \delta(p, q)-\sum_{k=n+p}^{\infty} \frac{[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!\Gamma(p+1+\mu)} a_{k} z^{k-p}
\end{align*}<\beta . \quad .
$$

Putting $z=r(0 \leq r<1)$ on the right-hand side of (2.2), and noting the fact that for $r=0$, the resulting expression in the denominator is positive, and remains so for all $r \in(0,1)$, the desrired inequality (2.1) follows upon letting $r \rightarrow 1^{-}$.
Corollary 1. Let the function $f(z) \in T_{p}(n)$ be given by (1.1). If $f(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$, then

$$
\begin{equation*}
a_{k} \leq \frac{(k-p)!\beta \Gamma(p+1+\mu) \delta(p, q)}{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}(k \geq n+p ; p, n \in N) \tag{2.3}
\end{equation*}
$$

The result is sharp for the function $f(z)$ given by

$$
\begin{gather*}
f(z)=z^{p}-\frac{(k-p)!\beta \Gamma(p+1+\mu) \delta(p, q)}{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)} z^{k} \\
(k \geq n+p ; p, n \in N) . \tag{2.4}
\end{gather*}
$$

We next prove the following growth and distortion property for the functions of the form (1.1) belonging to the class $T_{\mu}^{q}(n, p, \lambda, \beta)$.
Theorem 2. If a function $f(z)$ defined by (1.1) is in the class $T_{\mu}^{q}(n, p, \lambda, \beta)$. Then
$\left||f(z)|-|z|^{p}\right| \leq$

$$
\begin{equation*}
\frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)}|z|^{n+p} \tag{2.5}
\end{equation*}
$$

and (in general),

$$
\begin{align*}
& \left.\left|\left|f^{(m)}(z)\right|-\delta(p, m)\right| z\right|^{p-m} \mid \leq \\
& \quad \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)(n+p-q)!}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu)(n+p-m)!}|z|^{n+p-m}  \tag{2.6}\\
& \quad\left(z \in U ; p, n \in N ; m, q \in N_{0} ; m \leq q<p ; p>\max (m, q,-\mu)\right)
\end{align*}
$$

Inclusion and neighborhood properties of a certain subclasses of p-valent...

The results are sharp for the function $f(z)$ given by

$$
\begin{equation*}
f(z)=z^{p}-\frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)} z^{n+p} \tag{2.7}
\end{equation*}
$$

Proof. In view of Theorem 1, we have

$$
\begin{aligned}
& \frac{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)}{n!} \sum_{k=n+p}^{\infty} a_{k} \\
& \leq \sum_{k=n+p}^{\infty} \frac{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!} a_{k} \\
& \leq \beta \Gamma(p+1+\mu) \delta(p, q),
\end{aligned}
$$

which readily yields

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} a_{k} \leq \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)} \tag{2.8}
\end{equation*}
$$

Also, (2.1) yields

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} k!a_{k} \leq \frac{n!(n+p-q)!\beta \Gamma(p+1+\mu) \delta(p, q)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu)} \tag{2.9}
\end{equation*}
$$

Now, by differentiating both sides of (1.1) m-times, we have

$$
\begin{gather*}
f^{(m)}(z)=\delta(p, m) z^{p-m}-\sum_{k=n+p}^{\infty} \delta(k, m) a_{k} z^{k-m} \\
\left(p, n \in N ; m \in N_{0} ; p>m\right) \tag{2.10}
\end{gather*}
$$

Theorem 2 follows from (2.8), (2.9) and (2.10)
Finally, it is easy to see that the bounds in Theorem 2 are attained for the function $f(z)$ given by (2.7).
Theorem 3. Let the function $f(z)$ defined by (1.1) be in the class $T_{\mu}^{q}(n, p, \lambda, \beta)$, then
(i) $f(z)$ is p-valently close-to- convex of order $\alpha(0 \leq \alpha<p)$ in $|z|<r_{1}$, where

$$
\begin{equation*}
r_{1}=\inf _{k}\left\{\left(\frac{p-\alpha}{k}\right) \theta(p, q, \lambda, \mu, \beta ; k)\right\}^{\frac{1}{k-p}} \tag{2.11}
\end{equation*}
$$

(ii) $f(z)$ is $p$-valently starlike of order $\alpha(0 \leq \alpha<p)$ in $|z|<r_{2}$, where

$$
\begin{equation*}
r_{2}=\inf _{k}\left\{\left(\frac{p-\alpha}{k-\alpha}\right) \theta(p, q, \lambda, \mu, \beta ; k)\right\}^{\frac{1}{k-p}} \tag{2.12}
\end{equation*}
$$

(iii) $f(z)$ is $p$-valently convex of order $\alpha(0 \leq \alpha<p)$ in $|z|<r_{3}$, where

$$
\begin{equation*}
r_{3}=\inf _{k}\left\{\frac{p(p-\alpha)}{k(k-\alpha)} \theta(p, q, \lambda, \mu, \beta ; k)\right\}^{\frac{1}{k-p}} \tag{2.13}
\end{equation*}
$$

where

$$
\begin{equation*}
\theta(p, q, \lambda, \mu, \beta ; k)=\frac{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{\beta(k-p)!\Gamma(p+1+\mu) \delta(p, q)} \tag{2.14}
\end{equation*}
$$

$$
\left(k \geq n+p ; p, n \in N ; q \in N_{0} ; p>q ; \mu>-p ; 0 \leq \lambda \leq 1 ; 0 \leq \alpha<p ; 0<\beta \leq 1\right)
$$

Each of these results is sharp for the function $f(z)$ given by (2.4).
Proof. It is sufficient to show that

$$
\begin{align*}
& \left|\frac{f^{\prime}(z)}{z^{p-1}}-p\right| \leq p-\alpha \quad\left(|z|<r_{1} ; 0 \leq \alpha<p ; p \in N\right)  \tag{2.15}\\
& \left|\frac{z f^{\prime}(z)}{f(z)}-p\right| \leq p-\alpha \quad\left(|z|<r_{2} ; 0 \leq \alpha<p ; p \in N\right) \tag{2.16}
\end{align*}
$$

and that

$$
\begin{equation*}
\left|1+\frac{z f^{\prime \prime}(z)}{f^{\prime}(z)}-p\right| \leq p-\alpha \quad\left(|z|<r_{3} ; 0 \leq \alpha<p ; p \in N\right) \tag{2.17}
\end{equation*}
$$

for a function $f(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$, where $r_{1}, r_{2}$ and $r_{3}$ are defined by (2.11), (2.12) and (2.13), repectively. The details involved are fairly straightforward and may be omitted.

## 3 Properties of the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$

Applying the results of Section 2, which were obtained for the function $f(z)$ of the form (1.1) belonging to the class $T_{\mu}^{q}(n, p, \lambda, \beta)$, we now derive the corresponding results for the function $f(z)$ belonging to the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$.
Theorem 4. If a function $f(z)$ defined by (1.1) is in the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$, then

$$
\begin{align*}
& \| f(z)\left|-|z|^{p}\right| \leq \\
& \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)(p-q+\gamma)(p-q+\gamma+1)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)(n+p-q+\gamma)}|z|^{n+p} \tag{3.1}
\end{align*}
$$

and (in general),

Inclusion and neighborhood properties of a certain subclasses of p-valent...

$$
\begin{align*}
& \left.\left|\left|f^{(m)}(z)\right|-\delta(p, m)\right| z\right|^{p-m} \mid \leq \\
& \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)(p-q+\gamma)(p-q+\gamma+1)(n+p-q)!|z|^{n+p-m}}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)(n+p-q+\gamma)(n+p-m)!}  \tag{3.2}\\
& \quad\left(z \in U ; p, n \in N ; m, q \in N_{0} ; m \leq q<p\right) .
\end{align*}
$$

The results in (3.1) and (3.2) are sharp for the function $f(z)$ given by

$$
\begin{align*}
& f(z)=z^{p}- \\
& \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)(p-q+\gamma)(p-q+\gamma+1)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)(n+p-q+\gamma)} z^{n+p} \tag{3.3}
\end{align*}
$$

Proof. Assume that $f(z) \in T_{p}(n)$ is given by (1.1). Also, let function $g(z) \in$ $H_{\mu}^{q}(n, p, \lambda, \beta)$, occuring in the non-homogenous differential equation(1.11) be of the form:

$$
\begin{equation*}
g(z)=z^{p}-\sum_{k=n+p}^{\infty} b_{k} z^{k}\left(b_{k} \geq 0 ; p, n \in N\right) \tag{3.4}
\end{equation*}
$$

Then, we readily find from (1.11) that

$$
\begin{equation*}
a_{k}=\frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)} b_{k} \quad(k \geq n+p ; p, n \in N) \tag{3.5}
\end{equation*}
$$

so that

$$
\begin{equation*}
f(z)=z^{p}-\sum_{k=n+p}^{\infty} a_{k} z^{k}=z^{p}-\sum_{k=n+p}^{\infty} \frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)} b_{k} z^{k} \tag{3.6}
\end{equation*}
$$

and

$$
\begin{equation*}
\left||f(z)|-|z|^{p}\right| \leq|z|^{n+p} \sum_{k=n+p}^{\infty} \frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)} b_{k} \quad(z \in U) \tag{3.7}
\end{equation*}
$$

Next, since $g(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$, therefore, on using the assertion (2.8) of Theorem 2 , we get the following coefficient ineqality :

$$
\begin{equation*}
b_{k} \leq \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)}(k \geq n+p ; p, n \in N) \tag{3.8}
\end{equation*}
$$

which in conjunction with (3.6) and (3.7) yield

$$
\begin{aligned}
& \| f(z)\left|-|z|^{p}\right| \leq \\
& \qquad \frac{n!\beta \Gamma(p+1+\mu) \delta(p, q)}{(n+\beta)[(p+\mu)+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)}|z|^{n+p}
\end{aligned}
$$

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} \frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)} \quad(z \in U) . \tag{3.9}
\end{equation*}
$$

By noting the following summation result:

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} \frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)}=\frac{(p-q+\gamma)(p-q+\gamma+1)}{(n+p-q+\gamma)} \tag{3.10}
\end{equation*}
$$

where $\gamma \in R^{*}=R \backslash\{-n-p,-n-p-1, \ldots\}$. The assertion (3.1) of Theorem 4 follows from (3.9) and (3.10). The assertion (3.2) of Theorem 4 can be established by similarly applying (2.9), (3.5) and (3.10).
Theorem 5. Let the function $f(z)$ defined by (1.1) be in the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$, then $f(z)$ is $p$-valently close-to-convex of order $\delta(0 \leq \delta<p)$ in $|z|<r_{4}$, where

$$
r_{4}=\inf _{k}\left\{\theta(p, q, \lambda, \mu, \beta ; k) \frac{(p-\delta)(k-q+\gamma)(k-q+\gamma+1)}{k(p-q+\gamma)(p-q+\gamma+1)}\right\}^{\frac{1}{k-p}}
$$

$\left(k \geq n+p ; p, n \in N ; q \in N_{0} ; p>q ; \mu>-p ; 0 \leq \lambda \leq 1 ; 0 \leq \delta<p ; 0<\beta \leq 1 ; \gamma \in R^{*}\right)$,
where $\theta(p, q, \lambda, \mu, \beta ; k)$ is given by (2.14). The result is sharp for the function $f(z)$ given by (3.3).
Proof. Assume that $f(z) \in T_{p}(n)$ is given by (1.1). Also, let the function $g(z) \in$ $T_{\mu}^{q}(n, p, \lambda, \beta)$, occuring in the non-homogenous differential equation (1.11), be given by (3.4). Then, it sufficient to show that

$$
\left|\frac{f^{\prime}(z)}{z^{p-1}}-p\right|<p-\delta \quad\left(|z|<r_{4} ; 0 \leq \delta<p ; p \in N\right)
$$

Indeed, we have

$$
\left|\frac{f^{\prime}(z)}{z^{p-1}}-p\right| \leq \sum_{k=n+p}^{\infty} k a_{k}|z|^{k-p}
$$

and by using the coefficient relation (3.5) between the functions $f(z)$ and $g(z)$, we get

$$
\begin{equation*}
\left|\frac{f^{\prime}(z)}{z^{p-1}}-p\right| \leq \sum_{k=n+p}^{\infty} \frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)} k b_{k}|z|^{k-p} \leq p-\delta \tag{3.12}
\end{equation*}
$$

Since $g(z) \in T_{\mu}^{q}(n, p, \lambda, \beta)$, and we know from the assertion (2.1) of Theorem 1 that

$$
\sum_{k=n+p}^{\infty} \frac{(k+\beta-p)[(k+\mu)-\lambda(k-p)] \Gamma(k+\mu) \delta(k, q)}{(k-p)!} b_{k} \leq \beta \Gamma(p+1+\mu) \delta(p, q)
$$

Inclusion and neighborhood properties of a certain subclasses of p-valent...
hence, (3.11) is true if
$\left(\frac{k}{p-\delta}\right) \frac{(p-q+\gamma)(p-q+\gamma+1)}{(k-q+\gamma)(k-q+\gamma+1)}|z|^{k-p} \leq \theta(p, q, \lambda, \mu, \beta ; k) \quad(k \geq n+p ; p, n \in N)$,
where $\theta(p, q, \lambda, \mu, \beta ; k)$ is given by (2.14). Solving (3.12) for $|z|$, we obtain
$|z| \leq\left\{\theta(p, q, \lambda, \mu, \beta ; k) \cdot \frac{(p-\delta)(k-q+\gamma)(k-q+\gamma+1)}{k(p-q+\gamma)(p-q+\gamma+1)}\right\}^{\frac{1}{k-p}}(k \geq n+p ; p, n \in N)$
which obviously proves Theorem 5.
Remark 1. We note that the result obtained by Irmak et al. [10, Theorem 2.3] is not correct. The correct result is given by (3.11) with $p=1$ and $q=0$.
Theorem 6. Let the function $f(z)$ defined by (1.1) be in the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$, then $f(z)$ is p-valently starlike of order $\delta(0 \leq \delta<p)$ in $|z|<r_{5}$, where

$$
r_{5}=\inf _{k}\left\{\theta(p, q, \lambda, \mu, \beta ; k) \cdot \frac{(p-\delta)(k-q+\gamma)(k-q+\gamma+1)}{(k-\delta)(p-q+\gamma)(p-q+\gamma+1)}\right\}^{\frac{1}{k-p}}
$$

$\left(k \geq n+p ; p, n \in N ; q \in N_{0} ; p>q ; \mu>-p ; 0 \leq \lambda \leq 1 ; 0 \leq \delta<p ; 0<\beta \leq 1 ; \gamma \in R^{*}\right)$,
where $\theta(p, q, \lambda, \mu, \beta ; k)$ is given by (2.14). The result is sharp for the function $f(z)$ given by (3.3).
Theorem 7. Let the function $f(z)$ defined by (1.1) be in the class $H_{\mu}^{q}(n, p, \lambda, \beta ; \gamma)$, then $f(z)$ is p-valently convex of order $\delta(0 \leq \delta<p)$ in $|z|<r_{6}$, where

$$
r_{6}=\inf _{k}\left\{\theta(p, q, \lambda, \mu, \beta ; k) \cdot \frac{p(p-\delta)(k-q+\gamma)(k-q+\gamma+1)}{k(k-\delta)(p-q+\gamma)(p-q+\gamma+1)}\right\}^{\frac{1}{k-p}}
$$

$\left(k \geq n+p ; p, n \in N ; q \in N_{0} ; p>q ; \mu>-p ; 0 \leq \lambda \leq 1 ; 0 \leq \delta<p ; 0<\beta \leq 1 ; \gamma \in R^{*}\right)$,
where $\theta(p, q, \lambda, \mu, \beta ; k)$ is given by (2.14). The result is sharp for the function $f(z)$ given by (3.3).
Remark 2. We note that the results obtained by Irmak et al. [10, Theorems 3.3 and 3.4] are not correct. The correct results are given by (3.14) and (3.15), respectively, with $p=1$ and $q=0$.

## 4 Inclusion relations involving ( $n, \theta$ )-neighborhood for the class $T_{\mu}^{q}(n, p, \lambda, \beta)$

Following the works of Goodman[11], Ruscheweyh [15] and Altintas [2] (see also [5], [6], [9], and [13]) we define the $(n, \theta)$-neighborhood of a function $f^{(q)}(z)$ when $f \in T_{p}(n)$ by

$$
N_{n, p}^{\theta}\left(f^{(q)}, g^{(q)}\right)=
$$

$$
\begin{equation*}
\left\{g \in T_{p}(n): g(z)=z^{p}-\sum_{k=n+p}^{\infty} b_{k} z^{k} \text { and } \sum_{k=n+p}^{\infty} \delta(k, q) k\left|a_{k}-b_{k}\right| \leq \theta\right\} \tag{4.1}
\end{equation*}
$$

It follows from (4.1) that, if

$$
\begin{equation*}
h(z)=z^{p} \quad(p \in N) \tag{4.2}
\end{equation*}
$$

then

$$
\begin{equation*}
N_{n, p}^{\theta}(h)=\left\{g \in T_{p}(n): g(z)=z^{p}-\sum_{k=n+p}^{\infty} b_{k} z^{k} \text { and } \sum_{k=n+p}^{\infty} \delta(k, q) k\left|b_{k}\right| \leq \theta\right\} \tag{4.3}
\end{equation*}
$$

Next; we establish inclusion relationships for the function class $T_{\mu}^{q}(n, p, \lambda, \beta)$ involving the ( $\mathrm{n}, \theta$ ) -neighborhood $N_{n, p}^{\theta}(h)$ defined by (4.3).
Theorem 8. If

$$
\begin{equation*}
\theta=\frac{\beta \Gamma(p+1+\mu) \delta(p, q) n!}{[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}\left(\frac{n+p}{n+\beta}\right) \tag{4.4}
\end{equation*}
$$

then

$$
\begin{equation*}
T_{\mu}^{q}(n, p, \lambda, \beta) \subset N_{n, p}^{\theta}(h) \tag{4.5}
\end{equation*}
$$

Proof. Let $f \in T_{\mu}^{q}(n, p, \lambda, \beta)$.Then, in view of the assertion (2.1) of Theorem 1, we have

$$
\begin{gather*}
\frac{(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}{n!} \sum_{k=n+p}^{\infty} \delta(k, q) a_{k} \\
\leq \beta \Gamma(p+1+\mu) \delta(p, q) \tag{4.6}
\end{gather*}
$$

so that

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} \delta(k, q) a_{k} \leq \frac{\beta \Gamma(p+1+\mu) \delta(p, q) n!}{(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)} \tag{4.7}
\end{equation*}
$$

On the other hand, we also find from (2.1) and (4.7) that

$$
\begin{gathered}
\frac{[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}{n!} \sum_{k=n+p}^{\infty} \delta(k, q) k a_{k} \leq \beta \Gamma(p+1+\mu) \delta(p, q)+ \\
\frac{(p-\beta)[(p+\mu+n)] \Gamma(n+p+\mu)}{n!} \sum_{k=n+p}^{\infty} \delta(k, q) a_{k} \leq \beta \Gamma(p+1+\mu) \delta(p, q)+ \\
(p-\beta) \frac{[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}{n!} \frac{\beta \Gamma(p+1+\mu) \delta(p, q) n!}{(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)} \\
=\beta \Gamma(p+1+\mu) \delta(p, q)\left(\frac{n+p}{n+\beta}\right),
\end{gathered}
$$

that is

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} \delta(k, q) k a_{k} \leq \beta \frac{\Gamma(p+1+\mu) \delta(p, q) n!}{[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}\left(\frac{n+p}{n+\beta}\right)=\theta \tag{4.8}
\end{equation*}
$$

Remark 3. Putting $q=0$ and $p=1$ in Theorem 8, we obtain the following corollary.

## Corollary 2. If

$$
\begin{equation*}
\theta=\frac{\beta \Gamma(2+\mu) n!}{[1+\mu+n(1-\lambda)] \Gamma(n+1+\mu)}\left(\frac{n+1}{n+\beta}\right) \tag{4.9}
\end{equation*}
$$

then

$$
\begin{equation*}
T_{\mu}(n, \lambda, \beta) \subset N_{n}^{\theta}(h) \tag{4.10}
\end{equation*}
$$

## 5 Neighborhood for the class $T_{\mu}^{q, \alpha}(n, p, \lambda, \beta)$

In this section we determine the neighborhood for the class $T_{\mu}^{q, \alpha}(n, p, \lambda, \beta)$ which we define as follows. A function $f \in T_{p}(n)$ is said to be in the class $T_{\mu}^{q, \alpha}(n, p, \lambda, \beta)$ if there exist a function $g \in T_{\mu}^{q}(n, p, \lambda, \beta)$ such that

$$
\begin{equation*}
\left|\frac{f(z)}{g(z)}-1\right|<p-\alpha \quad(z \in U ; 0 \leq \alpha<p) \tag{5.1}
\end{equation*}
$$

Theorem 9. If $g \in T_{\mu}^{q}(n, p, \lambda, \beta)$ and

$$
\begin{gather*}
\alpha=p- \\
\frac{\theta(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}{(n+p)\{[(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)-\beta \Gamma(p+1+\mu) \delta(p, q) n!\}} \tag{5.2}
\end{gather*}
$$

where

$$
\begin{gathered}
\theta \leq p(n+p) \times \\
\left.\times\{\delta(n+p, q)-\beta \Gamma(p+1+\mu) \delta(p, q) n!)[(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)]^{-1}\right\}
\end{gathered}
$$

then

$$
\begin{equation*}
N_{n, p}^{\theta}(g) \subset T_{\mu}^{q, \alpha}(n, p, \lambda, \beta) \tag{5.4}
\end{equation*}
$$

Proof. Suppose that $f \in N_{n, p}^{\theta}(g)$, then we find from the definition (4.1) that

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} \delta(k, q) k\left|a_{k}-b_{k}\right| \leq \theta \tag{5.5}
\end{equation*}
$$

which implies the coefficient inequality

$$
\begin{equation*}
\sum_{k=n+p}^{\infty}\left|a_{k}-b_{k}\right| \leq \frac{\theta}{(n+p) \delta(n+p, q)} \quad\left(p>q, n, p \in N, q \in N_{0}\right) \tag{5.6}
\end{equation*}
$$

Next, since $g \in T_{\mu}^{q}(n, p, \lambda, \beta)$, we have

$$
\begin{equation*}
\sum_{k=n+p}^{\infty} b_{k} \leq \frac{\beta \Gamma(p+1+\mu) \delta(p, q) n!}{(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)} \tag{5.7}
\end{equation*}
$$

so that

$$
\begin{gathered}
\left|\frac{f(z)}{g(z)}-1\right| \leq \frac{\sum_{k=n+p}^{\infty}\left|a_{k}-b_{k}\right|}{1-\sum_{k=n+p}^{\infty}\left|b_{k}\right|} \\
\leq \frac{\theta}{1-\frac{\beta \Gamma(p+1+\mu) \delta(p, q) n!}{(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)}} \\
=\frac{\theta(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu)}{(n+p)\{[(n+\beta)[p+\mu+n(1-\lambda)] \Gamma(n+p+\mu) \delta(n+p, q)-\beta \Gamma(p+1+\mu) \delta(p, q) n!\}} \\
\leq p-\alpha,
\end{gathered}
$$

where $\alpha$ given by (5.2). This implies that $f \in T_{\mu}^{q, \alpha}(n, p, \lambda, \beta)$.
Remark 4. Putting $q=0$ and $p=1$ in Theorem 9, we obtain the following corollary.
Corollary 3. If $g \in T_{\mu}(n, \lambda, \beta)$, and

$$
\alpha=1-\frac{\theta(n+\beta)[1+\mu+n(1-\lambda)] \Gamma(n+1+\mu)}{(n+1)\{(n+\beta)[1+\mu+n(1-\lambda)] \Gamma(n+1+\mu)-\beta \Gamma(2+\mu) n!)\}},
$$

where

$$
\theta \leq(n+1)\left\{1-\beta \Gamma(2+\mu) n![(n+\beta)[1+\mu+A(1-\lambda)] \Gamma(n+1+\mu)]^{-1}\right\}
$$

then

$$
N_{n}^{\theta}(g) \subset T_{\mu}^{(\alpha)}(n, \lambda, \beta)
$$

## Acknowledgments

The author thanks the referees for their valuable suggestions to improve the paper.
