#### Abstract

In this article, we investigate additive properties of the Drazin inverse of elements in rings and algebras over an arbitrary field. The necessary and sufficient condition for the Drazin invertibility of $a-b$ is considered under the condition of $a b=\lambda b a$ in algebras over an arbitrary field. Moreover, we give explicit representations of $(a+b)^{D}$, as a function of $a, b, a^{D}$ and $b^{D}$, whenever $a^{3} b=b a$ and $b^{3} a=a b$.

## 1. Introduction

Throughout this article, $\mathcal{A}$ denotes an algebra over an arbitrary field $\mathbb{F}$ and $R$ denotes an associative ring with unity. Recall that the Drazin inverse of $a \in R$ is the element $b \in R$ (denoted by $a^{D}$ ) which satisfies the following equations [12]:

$$
b a b=b, \quad a b=b a, \quad a^{k}=a^{k+1} b .
$$

for some nonnegative integer $k$. The smallest integer $k$ is called the Drazin index of $a$, denoted by ind $(a)$. If $\operatorname{ind}(a)=1$, then $a$ is group invertible and the group inverse of $a$ is denoted by $a^{\sharp}$. It is well known that the Drazin inverse is unique, if it exists. The conditions in the definition of Drazin inverse are equivalent to:

$$
b a b=b, \quad a b=b a, \quad a-a^{2} b \text { is nilpotent. }
$$

The study of the Drazin inverse of the sum of two Drazin invertible elements was first developed by Drazin [12]. It was proved that $(a+b)^{D}=a^{D}+b^{D}$ provided that $a b=b a=0$. In recent years, many papers focused on the problem under some weaker conditions. For two complex matrices $A, B$, Hartwig et al.[15] expressed $(A+B)^{D}$ under one-sided condition $A B=0$. This result was extended to bounded linear operators on an arbitrary complex Banach space by Djordjević and Wei [10], and was extended for morphisms on arbitrary additive categories by Chen et al. [4]. In the article of Wei and Deng [22] and Zhuang et al. [24], the commutativity $a b=b a$ was assumed. In [22], they characterized the relationships of the Drazin inverse

[^0]between $A+B$ and $I+A^{D} B$ by Jordan canonical decomposition for complex matrices $A$ and $B$. In [24], Zhuang et al. extended the result in [22] to a ring $R$, and it was shown that if $a, b \in R$ are Drazin invertible and $a b=b a$, then $a+b$ is Drazin invertible if and only if $1+a^{D} b$ is Drazin invertible. More results on the Drazin inverse can also be found in $[1-3,6,7,9,11,13,14,16,17,19-24]$. The motivation for this article was the results in Deng [8], Cvetković-Ilić [5] and Liu et al. [18]. In [5, 8] the commutativity $a b=\lambda b a$ was assumed. In [8], the author characterized the relationships of the Drazin inverse between $a \pm b$ and $a a^{D}(a \pm b) b b^{D}$ by the space decomposition for operator matrices $a$ and $b$. In [18], the author gave explicit representations of $(a+b)^{D}$ of two matrices $a$ and $b$, as a function of $a, b, a^{D}$ and $b^{D}$, under the conditions $a^{3} b=b a$ and $b^{3} a=a b$. In this article, we extend the results in $[8,18]$ to more general settings.

As usual, the set of all Drazin invertible elements in an algebra $\mathcal{A}$ is denoted by $\mathcal{A}^{D}$. Similarly, $R^{D}$ indicates the set of all Drazin invertible elements in a ring $R$. Given $a \in \mathcal{A}^{D}$ (or $a \in R^{D}$ ), it is easy to see that $1-a a^{D}$ is an idempotent, which is denoted by $a^{\pi}$.

## 2. Under the Condition $a b=\lambda b a$

In this section, we will extend the result in [8] to an algebra $\mathcal{A}$ over an arbitrary field $\mathbb{F}$.
Lemma 2.1. Let $a, b \in \mathcal{A}$ be such that $a b=\lambda b a$ and $\lambda \in \mathbb{F} \backslash\{0\}$. Then
(1) $a b^{i}=\lambda^{i} b^{i} a$ and $a^{i} b=\lambda^{i} b a^{i}$.
(2) $(a b)^{i}=\lambda^{-\frac{i(i-1)}{2}} a^{i} b^{i}$ and $(b a)^{i}=\lambda^{\frac{i(i-1)}{2}} b^{i} a^{i}$.

Proof. (1) By hypothesis, we have

$$
a b^{i}=a b b^{i-1}=\lambda b a b^{i-1}=\lambda b a b b^{i-2}=\lambda^{2} b^{2} a b^{i-2}=\cdots=\lambda^{i} b^{i} a .
$$

Similarly, we can obtain that $a^{i} b=\lambda^{i} b a^{i}$.
(2) By hypothesis, it follows that

$$
\begin{aligned}
(a b)^{i} & =a b a b(a b)^{i-2}=\lambda^{-1} a^{2} b^{2}(a b)^{i-2}=\lambda^{-(1+2)} a^{3} b^{3}(a b)^{i-3} \\
& =\cdots=\lambda^{-\sum_{k=0}^{k=-i-1} k a^{i} b^{i}=\lambda^{-\frac{i(i-1)}{2}} a^{i} b^{i} .}
\end{aligned}
$$

Similarly, it is easy to get $(b a)^{i}=\lambda^{\frac{i(i-1)}{2}} a^{i} b^{i}$.
Lemma 2.2. Let $a, b \in \mathcal{A}$ be Drazin invertible and $\lambda \in \mathbb{F} \backslash\{0\}$. If $a b=\lambda b a$, then
(1) $a^{D} b=\lambda^{-1} b a^{D}$.
(2) $a b^{D}=\lambda^{-1} b^{D} a$.
(3) $(a b)^{D}=b^{D} a^{D}=\lambda^{-1} a^{D} b^{D}$.

Proof. Assume $k=\max \{\operatorname{ind}(a), \operatorname{ind}(b)\}$.
(1) By hypothesis, we have

$$
\begin{aligned}
a^{D}\left(a^{k} b\right) & =a^{D}\left(\lambda^{k} b a^{k}\right)=\lambda^{k} a^{D}\left(b a^{k+1} a^{D}\right)=\lambda^{k} a^{D}\left(\lambda^{-(k+1)} a^{k+1} b a^{D}\right) \\
& =\lambda^{-1} a^{D} a^{k+1} b a^{D}=\lambda^{-1} a^{k} b a^{D} .
\end{aligned}
$$

It follows that

$$
\begin{aligned}
a^{D} b & =\left(a^{D}\right)^{k+1} a^{k} b=\left(a^{D}\right)^{k} a^{D} a^{k} b=\lambda^{-1}\left(a^{D}\right)^{k} a^{k} b a^{D}=\cdots \\
& =\lambda^{-(k+1)} a^{k} b\left(a^{D}\right)^{k+1}=\lambda^{-1} b a^{k}\left(a^{D}\right)^{k+1}=\lambda^{-1} b a^{D} .
\end{aligned}
$$

Moreover,

$$
\left(b a^{D}\right)^{i}=\lambda^{-\frac{i(i-1)}{2}} b^{i}\left(a^{D}\right)^{i} \text { and }\left(a^{D} b\right)^{i}=\lambda^{\frac{i(i-1)}{2}}\left(a^{D}\right)^{i} b^{i} .
$$

(2) The proof is similar to (1).
(3) By (1), we have $a^{D} b=\lambda^{-1} b a^{D}$, then $\left(a a^{D}\right) b=\lambda^{-1} a b a^{D}=b\left(a a^{D}\right)$. By [12], we get $a a^{D} b^{D}=b^{D} a a^{D}$.

Similarly, we can obtain that $a b^{D} b=\lambda^{-1} b^{D} a b=b^{D} b a$ and $a^{D} b b^{D}=b b^{D} a^{D}$. This implies that

$$
\begin{gathered}
a b b^{D} a^{D}=b b^{D} a a^{D}=b^{D} a^{D} a b . \\
b^{D} a^{D} a b b^{D} a^{D}=b^{D} b b^{D} a^{D} a a^{D}=b^{D} a^{D} .
\end{gathered}
$$

and

$$
\begin{aligned}
(a b)^{k+1} b^{D} a^{D} & =\lambda^{-\frac{k(k+1)}{2}} a^{k+1} b^{k+1} b^{D} a^{D}=\lambda^{-\frac{k(k+1)}{2}} a^{k+1} b^{k} a^{D} \\
& =\lambda^{-\frac{k(k+1)}{2}} a^{k+1}\left(\lambda^{k} a^{D} b^{k}\right)=\lambda^{-\frac{k(k-1)}{2}} a^{k+1} a^{D} b^{k} \\
& =\lambda^{-\frac{k(k-1)}{2}} a^{k} b^{k}=(a b)^{k} .
\end{aligned}
$$

Then we get $(a b)^{D}=b^{D} a^{D}$. Similarly, we can check that $(a b)^{D}=\lambda^{-1} a^{D} b^{D}$.
Theorem 2.3. Let $a, b$ be Drazin invertible in $\mathcal{A}$. If $a b=\lambda b a$ and $\lambda \neq 0$, then $a-b$ is Drazin invertible if and only if $w=a a^{D}(a-b) b b^{D}$ is Drazin invertible. In this case,

$$
(a-b)^{D}=w^{D}+a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D} .
$$

Proof. Since $w=a a^{D}(a-b) b b^{D}$, we have $w=\left(1-a^{\pi}\right)(a-b)\left(1-b^{\pi}\right)$ and

$$
\begin{equation*}
a-b=w+(a-b) b^{\pi}+a^{\pi}(a-b)-a^{\pi}(a-b) b^{\pi} . \tag{1}
\end{equation*}
$$

By the proof of Lemma 2.2 (3), we have $a a^{D} b=b a a^{D}$ and $a b b^{D}=b^{D} b a$. This means that $a^{\pi} b=b a^{\pi}$ and $b^{\pi} a=a b^{\pi}$.
Let $s=\operatorname{ind}(a)$ and $t=\operatorname{ind}(b)$. By Lemma $2.2(1)$ and $b^{t} b^{\pi}=0$, we get

$$
\left(b b^{\pi} a^{D}\right)^{t}=\lambda^{-\frac{t(t-1)}{2}} b^{t} b^{\pi}\left(a^{D}\right)^{t}=0
$$

and $\left(1-b b^{\pi} a^{D}\right)^{-1}=1+b a^{D} b^{\pi}+\left(b a^{D}\right)^{2} b^{\pi}+\cdots+\left(b a^{D}\right)^{t-1} b^{\pi}$.
By a similar method, we get $1-b^{D} a a^{\pi}$ and $1-a a^{\pi} b^{D}$ are both invertible.
Note that $w a^{\pi}=a^{\pi} w=a^{\pi} a a^{D}(a-b) b b^{D}=0$ and $b^{\pi} w=w b^{\pi}=a a^{D}(a-b) b b^{D} b^{\pi}=0$ by $a^{\pi} b=b a^{\pi}$ and $b^{\pi} a=a b^{\pi}$.
Now let us begin the proof of Theorem 2.3. Assume $w$ is Drazin invertible and let

$$
x=w^{D}+a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D} .
$$

Since $a b^{\pi}=b^{\pi} a$ and $b a^{\pi}=a^{\pi} b$, it is easy to obtain that $w(a-b)=(a-b) w$ and $w^{D}(a-b)=(a-b) w^{D}$.
A direct computation yields

$$
\begin{aligned}
& (a-b)\left[a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}\right] \\
= & a a^{D}\left(1-b a^{D}\right) b^{\pi}\left(1-b b^{\pi} a^{D}\right)^{-1} \\
= & a a^{D}\left(1-b b^{\pi} a^{D}-b b b^{D} a^{D}\right) b^{\pi}\left(1-b b^{\pi} a^{D}\right)^{-1} \\
= & a a^{D}\left(1-b b^{\pi} a^{D}\right) b^{\pi}\left(1-b b^{\pi} a^{D}\right)^{-1} \\
= & a a^{D} b^{\pi} .
\end{aligned}
$$

Since $\left(1-b^{D} a a^{\pi}\right) b^{D}=b^{D}\left(1-a a^{\pi} b^{D}\right)$, we have

$$
\begin{aligned}
(a-b) a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D} & =(a-b) b^{D} a^{\pi}\left(1-a a^{\pi} b^{D}\right)^{-1} \\
& =-b b^{D}\left(1-a b^{D}\right) a^{\pi}\left(1-a a^{\pi} b^{D}\right)^{-1} \\
& =-b b^{D} a^{\pi} .
\end{aligned}
$$

So, by the above, we can obtain that

$$
\begin{align*}
(a-b) x & =(a-b)\left(w^{D}+a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}\right)  \tag{2}\\
& =(a-b) w^{D}+a a^{D} b^{\pi}+b b^{D} a^{\pi} .
\end{align*}
$$

Similar to the above way, we also have $\left[a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}\right](a-b)=a^{D} a b^{\pi}$ and $\left[a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}\right](a-b)=$ $-b^{D} b a^{\pi}$.
So, it follows $x(a-b)=w^{D}(a-b)+a^{D} a b^{\pi}+b^{D} b a^{\pi}$ and $x(a-b)=(a-b) x$.
We now prove that $x(a-b) x=x$.
Let $(a-b) x=x_{1}+x_{2}$ where $x_{1}=w^{D}(a-b)$ and $x_{2}=a^{D} a b^{\pi}+b^{D} b a^{\pi}$. Note that $w a^{\pi}=a^{\pi} w=0, w b^{\pi}=b^{\pi} w=0$ and $w^{D}(a-b)=(a-b) w^{D}$. By Eq.(1), we have

$$
\begin{equation*}
w^{D}(a-b)=w^{D}\left(w+(a-b) b^{\pi}+a^{\pi}(a-b)-a^{\pi}(a-b) b^{\pi}\right)=w^{D} w \tag{3}
\end{equation*}
$$

Then we have $w^{D} x_{1}=w^{D}$ and $w^{D} x_{2}=w^{D}\left(a a^{D} b^{\pi}+b b^{D} a^{\pi}\right)=w^{D} b^{\pi} a a^{D}+w^{D} a^{\pi} b b^{D}=0$.
Similarly, it is easy to get $\left(a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}\right) w^{D}=0$, this shows that $\left(a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-\right.$ $\left.a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}\right) x_{1}=0$.

$$
\begin{aligned}
& {\left[a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}\right] x_{2} } \\
= & {\left[a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}\right]\left(a^{D} a b^{\pi}+b^{D} b a^{\pi}\right) } \\
= & a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D} .
\end{aligned}
$$

So, we get $x(a-b) x=x$.
By Eq.(3), we have $(a-b)^{2} w^{D}=w^{2} w^{D}=w-w w^{\pi}$ and

$$
\begin{aligned}
& (a-b)\left(a a^{D} b^{\pi}+b b^{D} a^{\pi}\right) \\
= & (a-b)\left(\left(1-a^{\pi}\right) b^{\pi}+\left(1-b^{\pi}\right) a^{\pi}\right) \\
= & a b^{\pi}-b a^{\pi}+a a^{\pi}-b b^{\pi}-2 a a^{\pi} b^{\pi}+2 b b^{\pi} a^{\pi} .
\end{aligned}
$$

Then by Eq.(1) and Eq.(2), we have

$$
\begin{aligned}
& (a-b)-(a-b)^{2} x \\
= & (a-b)-(a-b)\left(w^{D}(a-b)+a^{D} a b^{\pi}+b^{D} b a^{\pi}\right) \\
= & (a-b)-\left(w-w w^{\pi}+a b^{\pi}-b a^{\pi}+a a^{\pi}-b b^{\pi}-2 a a^{\pi} b^{\pi}+2 b b^{\pi} a^{\pi}\right) \\
= & (a-b)-\left[(a-b)-(a-b) b^{\pi}-a^{\pi}(a-b)+a^{\pi}(a-b) b^{\pi}-w w^{\pi}\right. \\
& \left.+a b^{\pi}-b a^{\pi}+a a^{\pi}-b b^{\pi}-2 a a^{\pi} b^{\pi}+2 b b^{\pi} a^{\pi}\right] \\
= & (a-b)-\left((a-b)+b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}-w w^{\pi}\right) \\
= & -\left(b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}-w w^{\pi}\right) .
\end{aligned}
$$

Note that $\left(b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}\right)^{k}=(b-a)^{k} b^{\pi} a^{\pi}$ and $(b-a)^{k}=\sum_{i+j=k} \lambda_{i, j} b^{j} a^{i}$.
Let $k \geq 2 \max \{s, t\}$. Then we have $\left(b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}\right)^{k}=0$.
Since $\left(b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}\right) w w^{\pi}=w w^{\pi}\left(b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}\right)=0$, we have $b b^{\pi} a^{\pi}-a a^{\pi} b^{\pi}-w w^{\pi}$ is nilpotent.
Hence, we get $(a-b)^{D}=w^{D}+a^{D}\left(1-b b^{\pi} a^{D}\right)^{-1} b^{\pi}-a^{\pi}\left(1-b^{D} a a^{\pi}\right)^{-1} b^{D}$.
For the " only if " part: Assume $(a-b) \in \mathcal{A}^{D}$. Since $\left(b b^{D}\right)^{2}=b b^{D}, b b^{D} \in \mathcal{A}^{D}$. By Lemma 2.2 and $(a-b) b b^{D}=b b^{D}(a-b)$, we have $(a-b) b b^{D} \in \mathcal{A}^{D}$. Similarly, since $a a^{D}(a-b) b b^{D}=(a-b) b b^{D} a a^{D}$, we have $a a^{D}(a-b) b b^{D} \in \mathcal{A}^{D}$.

## 3. Under the Condition $a^{3} b=b a, b^{3} a=a b$.

In [18], Liu et al. gave the explicit representations of $(a+b)^{D}$ of two complex matrices under the condition $a^{3} b=b a$ and $b^{3} a=a b$. In this section, we will extend the result to a ring $R$ in which $2=1+1$ is Drazin invertible for the unity 1 .

Lemma 3.1. Let $a, b \in R$ be such that $a^{3} b=b a$ and $b^{3} a=a b$. then for $i \in \mathbb{N}$
(1) $b a^{i}=a^{3 i} b$ and $b^{i} a=a^{3^{i}} b^{i}$.
(2) $a b^{i}=b^{3 i} a$ and $a^{i} b=b^{3^{i}} a^{i}$.
(3) $a b=a^{26 i}(a b) b^{2 i}$ and $b a=b^{26 i}(b a) a^{2 i}$.

Proof. (1) By induction, it is easy to obtain (1) and (2).
(3) The proof is similar to [18, lemma 2.1].

Lemma 3.2. Let $a, b \in R^{D}$ be such that $a^{3} b=b a$ and $b^{3} a=a b$. Then
(1) $a^{\pi} b a^{D}=0$ and $a^{D} b a^{\pi}=0$.
(2) $b^{\pi} a b^{D}=0$ and $b^{D} a b^{\pi}=0$.

Proof. (1) By Lemma 3.1(1), there exists some $i \in \mathbb{N}$, such that $a^{\pi} b a^{D}=a^{\pi} b a^{i}\left(a^{D}\right)^{i+1}=a^{\pi} a^{3 i} b\left(a^{D}\right)^{i+1}=0$. Similarly, $a^{D} b a^{\pi}=0$.
(2) It is analogous to the proof of (1).

Corollary 3.3. Let $a, b \in R^{D}$ be such that $a^{3} b=b a$ and $b^{3} a=a b$. Then
(1) $\left(a^{D}\right)^{3} b=b a^{D}$ and $\left(b^{D}\right)^{3} a=a b^{D}$.
(2) $a a^{D}$ commutes with $b$ and $b^{D}$.
(3) $b b^{D}$ commutes with $a$ and $a^{D}$.
(4) $a b^{D}=b^{D} a^{3}$ and $b a^{D}=a^{D} b^{3}$.
(5) $a^{D} b^{D}=b^{D}\left(a^{D}\right)^{3}$ and $b^{D} a^{D}=a^{D}\left(b^{D}\right)^{3}$.
(6) $a^{D} b^{D}=b^{D} a^{D} b^{2}$ and $b^{D} a^{D}=a^{D} b^{D} a^{2}$.

Proof. (1) By hypothesis, $\left(a^{D}\right)^{3} b a a^{D}=\left(a^{D}\right)^{3} a^{3} b a^{D}$. By Lemma $3.2(1),\left(a^{D}\right)^{3} b=b a^{D}$. Similarly, we have $\left(b^{D}\right)^{3} a=a b^{D}$.
(2) By hypothesis and (1), we get $b a a^{D}=a^{3} b a^{D}=a^{3}\left(a^{D}\right)^{3} b=a a^{D} b$. Then $b^{D} a a^{D}=a a^{D} b^{D}$. (3) is analogous to the proof of (2).
(4) By (3), we get $b^{D} a^{3}=b^{D} a^{3} b b^{D}=b^{D} b a b^{D}=a b^{D}$. Similarly, $a^{D} b=a^{D} b^{3}$.
(5) By (1) and (3), we have $b^{D}\left(a^{D}\right)^{3}=b^{D}\left(a^{D}\right)^{3} b b^{D}=b^{D} b a^{D} b^{D}=a^{D} b^{D} b b^{D}=a^{D} b^{D}$. Similarly, $a^{D}\left(b^{D}\right)^{3}=b^{D} a^{D}$.
(6) By (5), we have $b^{D} a^{D} b^{2}=a^{D}\left(b^{D}\right)^{3} b^{2}=a^{D} b^{D}$. Similarly, $b^{D} a^{D}=a^{D} b^{D} a^{2}$.

In Corollary 3.3 (5), one can see that $a^{D} b^{D}=b^{D}\left(a^{D}\right)^{3}$ and $b^{D} a^{D}=a^{D}\left(b^{D}\right)^{3}$. In the following, we will consider the analogous condition of $a b^{3}=b a$ and $b a^{3}=a b$.

Lemma 3.4. Let $a, b \in R^{D}$ be such that $a b^{3}=b a$ and $b a^{3}=a b$. Then $a^{D} b^{D}=b^{3} a$ and $b^{D} a^{D}=a^{3} b$.
Proof. Similar to Lemma 3.2 and Corollary 3.3, we have $a^{D} b=b\left(a^{D}\right)^{3}$ and $b^{D} a=a\left(b^{D}\right)^{3}$.
Then we can obtain that $a a^{D} b=a b\left(a^{D}\right)^{3}=b a^{3}\left(a^{D}\right)^{3}=b a^{D} a$ and $b b^{D} a=a b^{D} b$.
This implies that

$$
\begin{aligned}
a^{3} b^{D} & =a^{3} b\left(b^{D}\right)^{2}=b a^{9}\left(b^{D}\right)^{2} \\
& =b^{D} b^{2} a^{9}\left(b^{D}\right)^{2}=b^{D} b a^{3} b\left(b^{D}\right)^{2} \\
& =b^{D} a b b\left(b^{D}\right)^{2}=b^{D} a\left(b b^{D}\right)^{2}=b^{D} a .
\end{aligned}
$$

So, we get $a^{D} b^{D}=a^{D} b^{D} a a^{D}=a^{D} a\left(b^{D}\right)^{3} a^{D}=\left(b^{D}\right)^{3} a^{D}$ and $b^{D} a^{D}=\left(a^{D}\right)^{3} b^{D}$.
Similar to the proof of Lemma 3.1, we have $a b=a^{2 i}(a b) b^{26 i}$ for $i \geqslant \max \{\operatorname{ind}(a), \operatorname{ind}(b)\}$. Then it is easy to get

$$
\begin{aligned}
& a b b^{D} a^{D}=b b^{D} a a^{D}=b^{D} b a^{D} a=b^{D} a^{D} a b \\
& b^{D} a^{D} a b b^{D} a^{D}=b^{D} b b^{D} a^{D} a a^{D} \\
& (a b)^{2} b^{D} a^{D}=(a b) a b b^{D} a^{D}=(a b) a a^{D} b b^{D}=a^{2 i}(a b) b^{26 i} a a^{D} b b^{D}=a^{2 i}(a b) b^{26 i}=a b .
\end{aligned}
$$

Then this implies that $(a b)^{\sharp}=b^{D} a^{D}$ and $(b a)^{\sharp}=a^{D} b^{D}$.
Hence, there exist $i \in \mathbb{N}$ such that

$$
\begin{aligned}
b^{D} a^{D} & =(a b)^{\sharp}=\left((a b)^{\sharp}\right)^{2} a b=b^{D} a^{D} b^{D} a^{D} b a^{3}=b^{D} a^{D} b^{D}\left(a^{D} a\right) b^{3} a^{2}=b^{D} a^{D} b^{D} b^{3} a^{2} \\
& =b^{D} a^{D}\left(b^{D} b\right) b^{2} a^{2}=b^{D} a^{D} b^{2} a^{2}=b^{D} a^{D} b a b^{3} a=b^{D} a^{D} a b^{6} a=b^{D} b^{6} a^{2} a^{D} \\
& =b^{4}\left(b^{D} b\right)(b a)\left(a^{D} a\right)=b^{4}\left(b^{D} b\right) b^{2 i}(b a) a^{26 i}\left(a^{D} a\right)=b^{4} b^{2 i}(b a) a^{26 i}=b^{4} b a \\
& =b^{5} a .
\end{aligned}
$$

and $a^{D} b^{D}=(b a)^{\sharp}=a^{5} b$.
So, we have $a^{D} b^{D}=\left(b^{D}\right)^{3} a^{D}=\left(b^{D}\right)^{2} b^{D} a^{D}=\left(b^{D}\right)^{2} b^{5} a=b^{2}\left(b b^{D}\right) b a=b^{2}\left(b b^{D}\right) b^{2 i} b a a^{26 i}=b^{3} a$ and $b^{D} a^{D}=$ $a^{3} b$.

Lemma 3.5. Let $a, b \in R^{D}$ be such that $a^{3} b=b a$ and $b^{3} a=a b$. Then the following statements hold:
(1) $a^{D} b^{D}=\left(b^{D}\right)^{3} a^{D}=b^{D} a^{D} a^{2}=b^{2} b^{D} a^{D}$.
(2) $b^{D} a^{D}=\left(a^{D}\right)^{3} b^{D}=a^{D} b^{D} b^{2}=a^{2} a^{D} b^{D}$.

Proof. Let $a^{D}=x \in R^{\sharp}$ and $b^{D}=y \in R^{\sharp}$. By Corollary 3.3, we have $x y^{3}=y x$ and $y x^{3}=x y$. Then by Lemma 3.4, it follows $x^{\sharp} y^{\sharp}=y^{3} x$ and $y^{\sharp} x^{\sharp}=x^{3} y$, that is, $a^{2} a^{D} b^{2} b^{D}=\left(b^{D}\right)^{3} a^{D}$.

Note that

$$
a^{2} a^{D} b^{2} b^{D}=a^{2} a^{D} b^{3}\left(b^{D}\right)^{2}=a^{2} b a^{D}\left(b^{D}\right)^{2}=a^{2}\left(a^{D}\right)^{3} b\left(b^{D}\right)^{2}=a^{D} b^{D}
$$

and

$$
b^{D} a^{D} a^{2}=b^{D} a^{3}\left(a^{D}\right)^{2}=a b^{D}\left(a^{D}\right)^{2}=a a^{D}\left(b^{D}\right)^{3} a^{D}=\left(b^{D}\right)^{3} a^{D} a a^{D}=\left(b^{D}\right)^{3} a^{D}
$$

So, we get $a^{D} b^{D}=\left(b^{D}\right)^{3} a^{D}=b^{D} a^{D} a^{2}$. Similarly, $b^{D} a^{D}=\left(a^{D}\right)^{3} b^{D}=a^{D} b^{D} b^{2}$.
Hence, by $b^{D} a^{D}=a^{D} b^{D} b^{2}$ and Corollary 3.3 (6), we have

$$
b^{2} b^{D} a^{D}=b^{D} b\left(b a^{D}\right)=b^{D} b a^{D} b^{3}=a^{D} b^{D} b^{4}=b^{D} a^{D} b^{2}=a^{D} b^{D} .
$$

Similarly, $a^{2} a^{D} b^{D}=b^{D} a^{D}$.
Lemma 3.6. Let $a, b \in R^{D}$ be such that $a^{3} b=b a$ and $b^{3} a=a b$. Then the following statements hold:
(1) $a a^{D} a^{4+i} b^{i} b b^{D}=a a^{D} a^{i} b^{j} b b^{D}$.
(2) $a a^{D} a^{2+i} b^{2+j} b b^{D}=a a^{D} a^{i} b^{j} b b^{D}$, where $i, j \in \mathbb{N}$.
(3) $a a^{D} a b b^{D}=a^{D}\left(b^{D}\right)^{2}$.
(4) $a a^{D} a^{3} b b^{D}=a^{D} b b^{D}$.
(5) $a a^{D} a^{2} b b b^{D}=a a^{D} b^{D}$.
(6) $a a^{D} a b^{2} b b^{D}=a^{D} b b^{D}$.
(7) $a b a^{\pi}=0$ and $b a b^{\pi}=0$.

Proof. (1) By Lemma 3.5 (2), we have

$$
a a^{D} a^{4} b b^{D}=a a^{D} a b a b^{D}=a b a^{2} a^{D} b^{D}=a b b^{D} a^{D}=a a^{D} b b^{D} .
$$

Then we get $a a^{D} a^{4+i} b^{j} b b^{D}=a a^{D} a^{i} b^{j} b b^{D}$.
(2) Note that $a^{2} a^{D} b^{2} b^{D}=a^{D} b^{D}$, Then we have $a a^{D} a^{2} b^{2} b b^{D}=a\left(a^{2} a^{D} b^{2} b^{D}\right) b=a a^{D} b b^{D}$. This implies that $a a^{D} a^{2+i} b^{2+j} b b^{D}=a a^{D} a^{i} b^{j} b b^{D}$.
(3) By Lemma 3.5 (2), we have $a a^{D} a b b^{D}=a^{2} a^{D} b^{D} b=b^{D} a^{D} b=a^{D}\left(b^{D}\right)^{3} b=a^{D}\left(b^{D}\right)^{2}$.
(4) $a a^{D} a^{3} b b^{D}=a a^{D} b a b^{D}=b a^{2} a^{D} b^{D}=b b^{D} a^{D}=a^{D} b b^{D}$.
(5) In the proof of Lemma 3.5 (1), we get $a^{2} a^{D} b^{2} b^{D}=a^{D} b^{D}$. Then we have

$$
a a^{D} a^{2} b b b^{D}=a\left(a a^{D} a b b b^{D}\right)=a a^{D} b^{D} .
$$

(6) Similar to (5), we have $a a^{D} a b^{2} b b^{D}=\left(a a^{D} a b b b^{D}\right) b=a^{D} b b^{D}$.
(7) For $k \geqslant \max \{\operatorname{ind}(a)$, $\operatorname{ind}(b)\}$, we have $a b a^{\pi}=a^{\pi} a b=a^{\pi} a^{26 k}(a b) b^{2 k}=0$ and $b a b^{\pi}=b^{\pi} b a=b^{\pi} b^{26 k}(b a) a^{2 k}=$ 0.

Theorem 3.7. Let $a, b \in R^{D}$ be such that $a^{3} b=b a$ and $b^{3} a=a b$. Suppose 2 is Drazin invertible. Then $a+b$ is Drazin invertible and

$$
(a+b)^{D}=\left(2^{D}\right)^{3} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D}+a^{D}\left(1-b b^{D}\right)+\left(1-a a^{D}\right) b^{D}
$$

Proof. Firstly, let $M=M_{1}+M_{2}+M_{3}$, where $M_{1}=\left(2^{D}\right)^{3} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D}, M_{2}=a^{D}\left(1-b b^{D}\right)$, $M_{3}=\left(1-a a^{D}\right) b^{D}$. In what follows, we show that $M$ is the Drazin inverse of $a+b$, i.e. the following conditions hold: (a). $M(a+b)=(a+b) M$, (b). $M(a+b) M=M$ and (c). $(a+b)-(a+b)^{2} M$ is nilpotent.
For the condition (a), we will show that $(a+b)$ is communicate with $M_{1}, M_{2}$ and $M_{3}$. By Corollary 3.3 (2) and (3), we have

$$
(a+b) M_{1}=\left(2^{D}\right)^{3} b b^{D}(a+b)\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D}
$$

and

$$
M_{1}(a+b)=\left(2^{D}\right)^{3} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right)(a+b) a a^{D} .
$$

After a calculation we can obtain

$$
\begin{aligned}
(a+b) M_{1}-M_{1}(a+b) & =\left(2^{D}\right)^{3} b b^{D}\left(3 a b^{3}+3 b a^{3}-3 a b-3 b a\right) a a^{D} \\
& =\left(2^{D}\right)^{3} 3\left(a a^{D} a^{9} b b b^{D}+a a^{D} b^{9} a b b^{D}-a a^{D} b a b b^{D}-a a^{D} a b b b^{D}\right)
\end{aligned}
$$

From Lemma 3.6 (1), one can get $a a^{D} a^{9} b b b^{D}=a a^{D} a b b b^{D}$. Similar to Lemma 3.6(1), it is easy to check that $a a^{D} b^{4+i} a^{j} b b^{D}=a a^{D} b^{i} a^{j} b b^{D}$ for $j \in \mathbb{N}$. Then one can see that $a a^{D} b^{9} a b b^{D}=a a^{D} b a b b^{D}$. This implies $M_{1}(a+b)=(a+b) M_{1}$.
Note that $a b b^{\pi}=0$, we get

$$
\begin{aligned}
(a+b) M_{2}-M_{2}(a+b) & =\left(b a^{D}-a^{D} b\right)\left(1-b b^{D}\right) \\
& =\left(\left(a^{D}\right)^{3} b-a^{D} b\right)\left(1-b b^{D}\right) \\
& =\left(\left(a^{D}\right)^{4}-\left(a^{D}\right)^{2}\right) a b\left(1-b b^{D}\right) \\
& =0
\end{aligned}
$$

Similarly, $(a+b) M_{3}-M_{3}(a+b)=\left(\left(b^{D}\right)^{4}-\left(b^{D}\right)^{2}\right) b a\left(1-a a^{D}\right)=0$. This means that $(a+b) M=M(a+b)$.
(b) By Corollary 3.3 (2)(3), we get

$$
\begin{aligned}
& M_{1}(a+b) M_{2}=M_{1}(a+b) M_{3}=0, \\
& M_{2}(a+b) M_{1}=M_{2}(a+b) M_{3}=0, \\
& M_{3}(a+b) M_{1}=M_{3}(a+b) M_{2}=0 .
\end{aligned}
$$

By hypothesis and Lemma 3.6, we can simplify

$$
\begin{aligned}
M_{1}(a+b) M_{1} & =\left(2^{D}\right)^{3} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D}(a+b)\left(2^{D}\right)^{3} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D} \\
& =\left(2^{D}\right)^{6} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right)(a+b)\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D} \\
& =\left(2^{D}\right)^{6} b b^{D}\left(25 a^{3}+25 b^{3}-a b^{2}-a^{2} b-8 a-8 b\right) a a^{D} \\
& =\left(2^{D}\right)^{6}\left(25 a^{D} b b^{D}+25 b^{D} a a^{D}-a^{D} b b^{D}-b^{D} a a^{D}-8 a^{D} b^{D} b^{D}-8 b^{D} a^{D} a^{D}\right) \\
& =\left(2^{D}\right)^{6}\left(24 a^{D} b b^{D}+24 b^{D} a a^{D}-8 a^{D} b^{D} b^{D}-8 b^{D} a^{D} a^{D}\right) \\
& =\left(2^{D}\right)^{3} b b^{D}\left(3 a^{3}+3 b^{3}-a-b\right) a a^{D} .
\end{aligned}
$$

Note that $a^{D} b a^{D}\left(1-b b^{D}\right)=a^{D}\left(1-b b^{D}\right) b a a^{D} a^{D}=0$ and $b^{D} a b^{D}\left(1-a a^{D}\right)=0$. After a calculation, we obtain

$$
\begin{aligned}
M(a+b) M & =M_{1}(a+b) M_{1}+M_{2}(a+b) M_{2}+M_{3}(a+b) M_{3} \\
& =M_{1}+a^{D}(a+b) a^{D}\left(1-b b^{D}\right)+b^{D}(a+b) b^{D}\left(1-a a^{D}\right) \\
& =M_{1}+\left(a^{D}+a^{D} b a^{D}\right)\left(1-b b^{D}\right)+\left(b^{D} a b^{D}+b^{D}\right)\left(1-a a^{D}\right) \\
& =M .
\end{aligned}
$$

(c) Note that $\left(a b a^{D}+b a a^{D}+b b a^{D}\right)\left(1-b b^{D}\right)=0$ and $\left(a a b^{D}+a b b^{D}+b a b^{D}\right)\left(1-a a^{D}\right)=0$.

Similar to the proof of (b), by Lemma 3.6, we have

$$
\begin{aligned}
(a+b)^{2} M= & (a+b)\left[\left(2^{D}\right)^{3} b b^{D}\left(3 a^{4}+3 a b^{3}+3 b a^{3}+3 b^{4}-a^{2}-a b-b a-b^{2}\right) a a^{D}\right. \\
& \left.+\left(a a^{D}+b a^{D}\right)\left(1-b b^{D}\right)+\left(1-a a^{D}\right)\left(a b^{D}+b b^{D}\right)\right] \\
= & \left(2^{D}\right)^{3} b b^{D}\left(3 a^{5}+3 a^{2} b^{3}+3 a b a^{3}+3 a b^{4}+3 b a^{4}+3 b a b^{3}+3 a^{2} b^{3}+3 b^{5}\right. \\
& \left.-a^{3}-a^{2} b-a b a-a b^{2}-b a^{2}-b a b-b^{2} a-b^{3}\right) a a^{D}+\left(a^{2} a^{D}+a b a^{D}\right. \\
& \left.+b a a^{D}+b b a^{D}\right)\left(1-b b^{D}\right)+\left(a a b^{D}+a b b^{D}+b a b^{D}+b b b^{D}\right)\left(1-a a^{D}\right) \\
= & \left(2^{D}\right)^{3}\left(8 a^{D} b^{D} b^{D}+8 b^{D} a^{D} a^{D}\right)+a^{2} a^{D}\left(1-b b^{D}\right)+b^{2} b^{D}\left(1-a a^{D}\right) \\
= & \left(2^{D}\right)^{3}\left(8 a^{D} b^{D} b^{D}+8 b^{D} a^{D} a^{D}\right)+a^{2} a^{D}-a^{D} b^{D} b^{D}+b^{2} b^{D}-b^{D} a^{D} a^{D} \\
= & a^{2} a^{D}+b^{2} b^{D}-\left(1-22^{D}\right)\left(a^{D} b^{D} b^{D}+b^{D} a^{D} a^{D}\right) .
\end{aligned}
$$

Note that $a^{D} b^{D} b^{D}+b^{D} a^{D} a^{D}=a a^{D}(a+b) b b^{D}$ and

$$
\left[\left(1-22^{D}\right) a a^{D}(a+b) b b^{D}\right]^{4}=2\left(1-22^{D}\right) a a^{D}\left(3+2 a^{3} b+2 a b+a^{2}\right) b b^{D}
$$

Since $a a^{\pi} b b^{\pi}=b b^{\pi} a a^{\pi}=0$ and $a a^{\pi} a a^{D}(a+b) b b^{D}=b b^{\pi} a a^{D}(a+b) b b^{D}=0$, it follows that $a+b-(a+b)^{2} M=$ $a a^{\pi}+b b^{\pi}-\left(1-22^{D}\right) a a^{D}(a+b) b b^{D}$ is nilpotent.

Example 3.8. Suppose $S=\mathbb{Z}_{8}$ and $R=S_{2 \times 2}$. Set $a=\left(\begin{array}{ll}4 & 0 \\ 0 & 0\end{array}\right)$ and $b=\left(\begin{array}{ll}2 & 0 \\ 0 & 3\end{array}\right)$. By direct computation, we have $a^{2}=0$ and $b^{3}=b^{D}=\left(\begin{array}{ll}0 & 0 \\ 0 & 3\end{array}\right)$. It is easy to check $a^{3} b=b a$ and $b^{3} a=a b$. Then by theorem 3.7 , one can obtain that $(a+b)^{D}=\left(\begin{array}{ll}0 & 0 \\ 0 & 3\end{array}\right)$.
