# Classification of Quasi-Sum Production Functions with Allen Determinants 

Muhittin Evren Aydin ${ }^{\text {a }}$, Adela Mihai ${ }^{\text {b }}$<br>${ }^{a}$ Department of Mathematics, Faculty of Science, Firat University, Elazig, 23200, Turkey<br>${ }^{b}$ Department of Mathematics and Computer Science, Technical University of Civil Engineering Bucharest, Bucharest, 020396, Romania

#### Abstract

In this paper, we derive an explicit formula for the determinant of Allen's matrix of quasi-sum production functions. We completely classify the quasi-sum production functions by using their Allen determinants. Further, we give some geometric applications of Allen determinants.

## 1. Introduction

In economics, a production function is a mathematical expression which denotes the physical relations between the output generated of a firm, an industry or an economy and inputs that have been used. Explicitly, a production function is a map which has non-vanishing first derivatives defined by

$$
\begin{equation*}
f: \mathbb{R}_{+}^{n} \longrightarrow \mathbb{R}_{+}, f=f\left(x_{1}, x_{2}, \ldots, x_{n}\right), \tag{1.1}
\end{equation*}
$$

where $f$ is the quantity of output, $n$ is the number of inputs and $x_{1}, x_{2}, \ldots, x_{n}$ are the inputs. For more detailed properties of production functions, see $[4,13,17,19,20]$.

A production function $f$ is called quasi-sum if there are continuous strict monotone functions $h_{i}: \mathbb{R}_{+} \longrightarrow$ $\mathbb{R}, i=1, \ldots, n$, and there exist an interval $I \subset \mathbb{R}$ of positive length and a continuous strict monotone function $F: I \longrightarrow \mathbb{R}$ such that for each $\mathbf{x}=\left(x_{1}, \ldots, x_{n}\right) \in \mathbb{R}_{+}^{n}$ we have $h_{1}\left(x_{1}\right)+\ldots+h\left(x_{n}\right) \in I$ and

$$
\begin{equation*}
f(\mathbf{x})=F\left(h_{1}\left(x_{1}\right)+\ldots+h\left(x_{n}\right)\right) . \tag{1.2}
\end{equation*}
$$

The justification for studying production functions of quasi-sum form is that these functions appear as solutions of the general bisymmetry equation and they are related to the problem of consistent aggregation $[1,7]$. A quasi-sum production function is called quasi-linear if at most one of $F, h_{1}, \ldots, h_{n}$ from (1.2) is a nonlinear function.

The most common quantitative indices of production factor substitutability are forms of the elasticity of substitution. R.G.D. Allen and J.R. Hicks [2] suggested two generalizations of Hicks' original two variable elasticity concept.

The first concept, called Hicks elasticity of substitution, is defined as follows.

[^0]Let $f\left(x_{1}, \ldots, x_{n}\right)$ be a production function. Then Hicks elasticity of substitution of the $i-$ th production variable with respect to the $j-$ th production variable is given by

$$
\begin{equation*}
H_{i j}(\mathbf{x})=-\frac{\frac{1}{x_{i} f_{i}}+\frac{1}{x_{j} f_{j}}}{\frac{f_{j i}}{\left(f_{i}\right)^{2}}-\frac{2 f_{i j}}{f_{i} f_{j}}+\frac{f_{j j}}{\left(f_{j}\right)^{2}}}\left(\mathbf{x} \in \mathbb{R}_{+}^{n}, i, j=1, \ldots, n, i \neq j\right), \tag{1.3}
\end{equation*}
$$

where $f_{i}=\partial f / \partial x_{i}, f_{i j}=\partial^{2} f / \partial x_{i} \partial x_{j}$.
L. Losonczi [14] classified homogeneous production functions of 2 variables, having constant Hicks elasticiy of substitution. Then, the classification of L. Losonczi was extended to $n$ variables by B-Y. Chen [6].

The second concept, investigated by R.G.D. Allen [2] and H. Uzawa [18] , is the following:
Let $f$ be a production function. Then Allen elasticity of substitution of the $i-$ th production variable with respect to the $j$-th production variable is defined by

$$
\begin{equation*}
A_{i j}(\mathbf{x})=-\frac{x_{1} f_{1}+x_{2} f_{2}+\ldots+x_{n} f_{n}}{x_{i} x_{j}} \frac{D_{i j}}{D}\left(\mathbf{x}=\left(x_{1}, \ldots, x_{n}\right) \in \mathbb{R}_{+}^{n}, i, j=1, \ldots, n, i \neq j\right) \tag{1.4}
\end{equation*}
$$

where $D$ is the determinant of the matrix

$$
M(f)=\left(\begin{array}{ccccc}
0 & f_{1} & \ldots & f_{n-1} & f_{n}  \tag{1.5}\\
f_{1} & f_{11} & \ldots & f_{1 n-1} & f_{1 n} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
f_{n-1} & f_{1 n-1} & \ldots & f_{n-1 n-1} & f_{n-1 n} \\
f_{n} & f_{1 n} & \ldots & f_{n-1 n} & f_{n n}
\end{array}\right)
$$

and $D_{i j}$ is the co-factor of the element $f_{i j}$ in the determinant $D(D \neq 0$ is assumed). $M(f)$ is called the Allen's matrix and we call $\operatorname{det}(M(f))$ the Allen determinant.

It is a simple calculation to show that in case of two variables Hicks elasticity of substitution coincides with Allen elasticity of substitution.

In this paper, we focus on the singularity of the Allen's matrix of quasi-sum production functions, by analogy to the Hessian Determinant Formula given by B.-Y. Chen in [10] for the composite functions of the form:

$$
\begin{equation*}
f(\mathbf{x})=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\ldots+h_{n}\left(x_{n}\right)\right) . \tag{1.6}
\end{equation*}
$$

We give an explicit formula for Allen determinant of quasi-sum production functions. We classify the quasi-sum production functions by their Allen determinants. Further we give some geometric applications of Allen determinants.

## 2. Quasi-Sum Production Functions with Allen Determinants

Allen Determinant Formula. Let $f=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\ldots+h_{n}\left(x_{n}\right)\right)$ be a quasi-sum production function of $n$ variables. Then the determinant of the Allen's matrix $M(f)$ is given by

$$
\begin{equation*}
\operatorname{det}(M(f))=-\left(F^{\prime}\right)^{n+1} \sum_{j=1}^{n} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{n}^{\prime \prime} \tag{2.1}
\end{equation*}
$$

where $h_{j}^{\prime}=\frac{d h_{j}}{d x_{j}}, h_{j}^{\prime \prime}=\frac{d^{2} h_{j}}{d x_{j}^{2}}$, for $j=1, \ldots, n$, and $F^{\prime}=F^{\prime}(u)$, for $u=h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\ldots+h_{n}\left(x_{n}\right)$.
Proof. Let $f=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\ldots+h_{n}\left(x_{n}\right)\right)$ be a twice differentiable quasi-sum production function. First we show that the equality (2.1) is satisfied for $n=2$. For this, the Allen's matrix for the two variables
quasi-sum production function $f=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)\right)$ is given by

$$
M(f)=\left(\begin{array}{ccc}
0 & f_{1} & f_{2}  \tag{2.2}\\
f_{1} & f_{11} & f_{12} \\
f_{2} & f_{21} & f_{22}
\end{array}\right),
$$

where $f_{i}=\frac{\partial f}{\partial x_{i}}, f_{i j}=\frac{\partial^{2} f}{\partial x_{i} \partial x_{j}}$. Then, in our case,

$$
\begin{equation*}
f_{i}=h_{i}^{\prime} F^{\prime}, f_{i j}=h_{i}^{\prime} h_{j}^{\prime} F^{\prime \prime}, \text { for } i \neq j \text {, and } f_{i i}=\left(h_{i}^{\prime}\right)^{2} F^{\prime \prime}+h_{i}^{\prime \prime} F^{\prime} \tag{2.3}
\end{equation*}
$$

So, we write the Allen's matrix for the two variables quasi-sum production function $f=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)\right)$ as follows:

$$
M(f)=\left(\begin{array}{ccc}
0 & h_{1}^{\prime} F^{\prime} & h_{2}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & h_{1}^{\prime} h_{2}^{\prime} F^{\prime \prime} \\
h_{2}^{\prime} F^{\prime} & h_{1}^{\prime} h_{2}^{\prime} F^{\prime \prime} & \left(h_{2}^{\prime}\right)^{2} F^{\prime \prime}+h_{2}^{\prime \prime} F^{\prime}
\end{array}\right)
$$

The determinat of $M(f)$ is

$$
\begin{equation*}
\operatorname{det}(M(f))=-\left(F^{\prime}\right)^{3}\left[\left(h_{1}^{\prime}\right)^{2}\left(h_{2}^{\prime \prime}\right)+\left(h_{1}^{\prime \prime}\right)\left(h_{2}^{\prime}\right)^{2}\right] \tag{2.4}
\end{equation*}
$$

Therefore, we have formula (2.1) for $n=2$.
Now, we prove the formula (2.1) by mathematical induction. Let us assume that (2.1) holds for $n=k$, with $n \geq 2$. We shall show that (2.1) is satisfied for $n=k+1$. For $n=k+1$, we have

$$
M(f)=\left(\begin{array}{ccccc}
0 & f_{1} & \ldots & f_{k} & f_{k+1}  \tag{2.5}\\
f_{1} & f_{11} & \ldots & f_{1 k} & f_{1 k+1} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
f_{k} & f_{1 k} & \ldots & f_{k k} & f_{k k+1} \\
f_{k+1} & f_{1 k+1} & \ldots & f_{k k+1} & f_{k+1 k+1}
\end{array}\right)
$$

and then the determinant of $M(f)$ is given by

$$
\operatorname{det}(M(f))=\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime}  \tag{2.6}\\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k}^{\prime}\right)^{2} F^{\prime \prime}+h_{k}^{\prime \prime} F^{\prime} & h_{k}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
h_{k+1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} & \ldots & h_{k}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} & \left(h_{k+1}^{\prime}\right)^{2} F^{\prime \prime}+h_{k+1}^{\prime \prime} F^{\prime}
\end{array}\right|
$$

Now, we apply some elementary transformations for the determinant.
We replace the $(k+2)$-th row by $(k+2)$-th row minus $h_{k+1}^{\prime} / h_{k}^{\prime}$ times the $(k+1)-$ th row; then we obtain

$$
\operatorname{det}(M(f))=\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k}^{\prime}\right)^{2} F^{\prime \prime}+h_{k}^{\prime \prime} F^{\prime} & h_{k}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
0 & 0 & \ldots & -\frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} F^{\prime} & h_{k+1}^{\prime \prime} F^{\prime}
\end{array}\right|
$$

$$
+\frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} F^{\prime}\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k-1}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k-1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k-1}^{\prime}\right)^{2} F^{\prime \prime}+h_{k-1}^{\prime \prime} F^{\prime} & h_{k-1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
h_{k}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \ldots & h_{k-1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & h_{k}^{\prime} h_{k+1}^{\prime} F^{\prime \prime}
\end{array}\right| .
$$

The determinant from the formula (2.7) can be calculated by replacing the $(k+1)-$ th row by the $(k+1)-$ th row minus $h_{k}^{\prime} / h_{k-1}^{\prime}$ times $k$-th row,

$$
\begin{aligned}
|B| \stackrel{n o t}{=}\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k-1}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k-1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k-1}^{\prime}\right)^{2} F^{\prime \prime}+h_{k-1}^{\prime \prime} F^{\prime} & h_{k-1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
h_{k}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \ldots & h_{k-1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & h_{k}^{\prime} h_{k+1}^{\prime} F^{\prime \prime}
\end{array}\right| \\
=\frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} F^{\prime}\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k-1}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k-1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k-1}^{\prime}\right)^{2} F^{\prime \prime}+h_{k-1}^{\prime \prime} F^{\prime} & h_{k-1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
0 & 0 & \ldots & -\frac{h_{k}^{\prime} h_{k-1}^{\prime \prime} F^{\prime}}{h_{k-1}} & 0
\end{array}\right|
\end{aligned}
$$

$$
\begin{align*}
& =\frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} F^{\prime}\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k-1}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k-1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k-1}^{\prime}\right)^{2} F^{\prime \prime}+h_{k-1}^{\prime \prime} F^{\prime} & h_{k-1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
h_{k}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \ldots & h_{k-1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & h_{k}^{\prime} h_{k+1}^{\prime} F^{\prime \prime}
\end{array}\right| \\
& +h_{k+1}^{\prime \prime} F^{\prime}\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k}^{\prime} F^{\prime} & h_{k}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k-1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k-1}^{\prime}\right)^{2} F^{\prime \prime}+h_{k-1}^{\prime \prime} F^{\prime} & h_{k-1}^{\prime} h_{k}^{\prime} F^{\prime \prime} \\
h_{k}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \ldots & h_{k-1}^{\prime} h_{k}^{\prime} F^{\prime \prime} & \left(h_{k}^{\prime}\right)^{2} F^{\prime \prime}+h_{k}^{\prime \prime} F^{\prime}
\end{array}\right| \\
& -\left(F^{\prime}\right)^{k} \sum_{j=1}^{k} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{k}^{\prime \prime} \\
& =h_{k+1}^{\prime \prime}\left(-\left(F^{\prime}\right)^{k+1} \sum_{j=1}^{k} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{k}^{\prime \prime}\right) \tag{2.7}
\end{align*}
$$

$$
=\frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} \frac{h_{k}^{\prime} h_{k-1}^{\prime \prime}}{h_{k-1}^{\prime}}\left(F^{\prime}\right)^{2}
$$

$$
\cdot\left|\begin{array}{ccccc}
0 & h_{1}^{\prime} F^{\prime} & \ldots & h_{k-1}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{\prime} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & \ldots & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & h_{1}^{\prime} h_{k+1}^{1} F^{\prime \prime} \\
\vdots & \vdots & \ldots & \vdots & \vdots \\
h_{k-2}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-2}^{\prime} F^{\prime \prime} & \ldots & \left(h_{k-2}^{\prime}\right)^{2} F^{\prime \prime}+h_{k-2}^{\prime \prime} F^{\prime} & h_{k-2}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
h_{k-1}^{\prime} F^{\prime} & h_{1}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & \ldots & h_{k-2}^{\prime} h_{k-1}^{\prime} F^{\prime \prime} & h_{k-1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime}
\end{array}\right| .
$$

By similar calculations, we finally obtain:

$$
\begin{align*}
|B|= & \frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} \frac{h_{k}^{\prime} h_{k-1}^{\prime \prime}}{h_{k-1}^{\prime}} \frac{h_{k-1}^{\prime} h_{k-2}^{\prime \prime}}{h_{k-2}^{\prime}} \ldots \frac{h_{4}^{\prime} h_{3}^{\prime \prime}}{h_{3}^{\prime}} \frac{h_{3}^{\prime} h_{2}^{\prime \prime}}{h_{2}^{\prime}}\left(F^{\prime}\right)^{k-2} \cdot\left|\begin{array}{ccc}
0 & h_{1}^{\prime} F^{\prime} & h_{k+1}^{\prime} F^{\prime} \\
h_{1}^{\prime} F^{\prime} & \left(h_{1}^{\prime}\right)^{2} F^{\prime \prime}+h_{1}^{\prime \prime} F^{\prime} & h_{1}^{\prime} h_{k+1}^{\prime} F^{\prime \prime} \\
0 & -\frac{h_{2}^{\prime} h_{1}^{\prime \prime}}{h_{1}^{\prime}} F^{\prime} & 0
\end{array}\right|  \tag{2.8}\\
& =\frac{h_{k+1}^{\prime} h_{k}^{\prime \prime}}{h_{k}^{\prime}} \frac{h_{k}^{\prime} h_{k-1}^{\prime \prime}}{h_{k-1}^{\prime}} \frac{h_{k-1}^{\prime}}{h_{k-2}^{\prime}} \ldots \frac{h_{k-2}^{\prime \prime}}{h_{4}^{\prime}} \frac{h_{4}^{\prime} h_{3}^{\prime \prime}}{h_{3}^{\prime}} \frac{h_{3}^{\prime} h_{2}^{\prime \prime}}{h_{2}^{\prime}}\left(F^{\prime}\right)^{k-2} \frac{h_{2}^{\prime} h_{1}^{\prime \prime}}{h_{1}^{\prime}} F^{\prime}\left(-h_{1}^{\prime} h_{k+1}^{\prime}\left(F^{\prime}\right)^{2}\right) \\
& =-h_{1}^{\prime \prime} h_{2}^{\prime \prime} \ldots h_{k}^{\prime \prime}\left(h_{k+1}^{\prime}\right)^{2}\left(F^{\prime}\right)^{k+1} .
\end{align*}
$$

From (2.7) and (2.8), we get:

$$
\begin{aligned}
\operatorname{det}(M(f)) & =-h_{k+1}^{\prime \prime}\left(\left(F^{\prime}\right)^{k+1} \sum_{j=1}^{k} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{k}^{\prime \prime}\right)-h_{1}^{\prime \prime} h_{2}^{\prime \prime} \ldots h_{k}^{\prime \prime}\left(h_{k+1}^{\prime}\right)^{2}\left(F^{\prime}\right)^{k+1} \\
& =-\left(F^{\prime}\right)^{k+1} \sum_{j=1}^{k+1} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{n}^{\prime \prime}
\end{aligned}
$$

which completes the proof.
$F$ being strict monotone, $F^{\prime} \neq 0$; then, by the Allen Determinant Formula, it follows immediately
Corollary 2.1. The singularity of Allen's matrix for quasi-sum production function $f=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\right.$ $\left.\ldots+h_{n}\left(x_{n}\right)\right)$ depends only on the functions $h_{1}, \ldots, h_{n}$.

Next result completely classifies quasi-sum production functions whose Allen's matrices are singular.
Theorem 2.2. Let $f$ be a twice differentiable quasi-sum production function, $f(\mathbf{x})=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\ldots+\right.$ $h_{n}\left(x_{n}\right)$ ). Then the Allen's matrix $M(f)$ is singular if and only if $f$ is one of the following forms:
(1) $f=F\left(c_{1} x_{1}+c_{2} x_{2}+h_{3}\left(x_{3}\right)+\ldots+h_{n}\left(x_{n}\right)\right)$, where $c_{1}, c_{2}$ are nonzero constants and $F, h_{3}, \ldots, h_{n}$ are strict monotone functions;
(2) $f=F\left(\sum_{i=1}^{n} c_{i} \ln \left|x_{i}+d_{i}\right|+e_{i}\right)$, where $c_{i}$ are nonzero constans and $d_{i}, e_{i}$ are some constants.

Proof. Let us consider the twice differentiable quasi-sum production function given by

$$
\begin{equation*}
f=F\left(h_{1}\left(x_{1}\right)+h_{2}\left(x_{2}\right)+\ldots+h_{n}\left(x_{n}\right)\right) . \tag{2.9}
\end{equation*}
$$

Hence $F, h_{1}, \ldots, h_{n}$ are continuous strict monotone functions. Applying the Allen Determinant Formula for (2.9), we get

$$
\begin{equation*}
\operatorname{det}(M(f))=-\left(F^{\prime}\right)^{n+1} \sum_{j=1}^{n} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{n}^{\prime \prime} \tag{2.10}
\end{equation*}
$$

If the Allen's matrix $M(f)$ is singular, then by (2.10) it follows that:

$$
\begin{equation*}
\sum_{j=1}^{n} h_{1}^{\prime \prime} \ldots h_{j-1}^{\prime \prime}\left(h_{j}^{\prime}\right)^{2} h_{j+1}^{\prime \prime} \ldots h_{n}^{\prime \prime}=0 \tag{2.11}
\end{equation*}
$$

Case 1. One of the $h_{1}^{\prime \prime}, \ldots, h_{n}^{\prime \prime}$ vanishes. We may assume that $h_{1}^{\prime \prime}=0$. Hence we get from (2.11)

$$
\begin{equation*}
h_{2}^{\prime \prime} \ldots h_{n}^{\prime \prime}=0, \tag{2.12}
\end{equation*}
$$

because $h_{1}^{\prime} \neq 0, h_{1}$ being strict monotone. From (2.12), we may assume $h_{2}^{\prime \prime}=0$ and thus we have for $k=1,2$

$$
h_{k}\left(x_{k}\right)=c_{k} x_{k}+d_{k}
$$

where $c_{k}$ are nonzero constants and $d_{k}$ are some constants. Therefore the production function takes the form:

$$
f=F\left(c_{1} x_{1}+c_{2} x_{2}+h_{3}\left(x_{3}\right)+\ldots+h_{n}\left(x_{n}\right)\right)
$$

where $c_{1}, c_{2}$ are nonzero constants and $h_{3}, \ldots, h_{n}$ are strict monotone functions. This gives first part of the theorem.

Case 2. $h_{1}^{\prime \prime}, \ldots, h_{n}^{\prime \prime}$ are nonzero. Then from (2.11) , by dividing with the product $h_{1}^{\prime \prime}, \ldots, h_{n}^{\prime \prime}$, we write

$$
\begin{equation*}
\frac{\left(h_{1}^{\prime}\right)^{2}\left(x_{1}\right)}{h_{1}^{\prime \prime}\left(x_{1}\right)}+\ldots+\frac{\left(h_{n}^{\prime}\right)^{2}\left(x_{n}\right)}{h_{n}^{\prime \prime}\left(x_{n}\right)}=0 . \tag{2.13}
\end{equation*}
$$

Taking partial derivative of (2.13) with respect to $x_{i}$, we derive

$$
\begin{equation*}
\frac{h_{i}^{\prime} h_{i}^{\prime \prime \prime}}{\left(h_{i}^{\prime \prime}\right)^{2}}=2, i=1, \ldots, n \tag{2.14}
\end{equation*}
$$

By solving (2.14) we find $h_{i}\left(x_{i}\right)=c_{i} \ln \left|x_{i}+d_{i}\right|+e_{i}$, where $c_{i}$ are nonzero constans and $d_{i}, e_{i}$ are some constants. If $f$ has the form (1) or (2), it is easily seen that $M(f)$ is singular. This completes the proof.

## 3. An Application of Allen Determinants for Composite Functions

Theorem 3.1. Let $F(u)$ be a twice differentiable function with $F^{\prime}(u) \neq 0$ and let

$$
f=F\left(\sum_{i=1}^{n} b_{i} x_{i}^{c_{i}}\right)
$$

be the composite of $F$ and $r(\mathbf{x})=\sum_{i=1}^{n} b_{i} x_{i}^{c_{i}}$, where $b_{i}(i=1, \ldots, n)$ are nonzero constants. Then the Allen's matrix $M(f)$ of $f$ is singular if and only if one of the following conditions occurs:
(i) At least one of the $c_{1}, \ldots, c_{n}$ vanishes;
(ii) At least two of $c_{1}, \ldots, c_{n}$ are equal to one.

Proof. Under the hypothesis of theorem, we can write

$$
\begin{equation*}
h_{i}\left(x_{i}\right)=b_{i} x_{i}^{c_{i}}, i=1, \ldots, n . \tag{3.1}
\end{equation*}
$$

Thus the composite function $f=F\left(\sum_{i=1}^{n} b_{i} x_{i}^{c_{i}}\right)$ takes the form:

$$
f=F\left(h_{1}\left(x_{1}\right)+\ldots+h_{n}\left(x_{n}\right)\right) .
$$

From (3.1), we have

$$
h_{i}^{\prime}=b_{i} c_{i} x_{i}^{c_{i}-1} \text { and } h_{i}^{\prime \prime}=b_{i} c_{i}\left(c_{i}-1\right) x_{i}^{c_{i}-2}, i=1, \ldots, n
$$

If we apply the Allen Determinant Formula for the composite function $f=F \circ r$, then we get

$$
\begin{aligned}
\operatorname{det}(M(f))= & -\left(F^{\prime}\right)^{n+1} \\
& \cdot \sum_{j=1}^{n}\left\{\left[b_{1} c_{1}\left(c_{1}-1\right) x_{1}^{c_{1}-2}\right] \ldots\left[b_{j} c_{j}\left(c_{j}-1\right) x_{j}^{c_{j}-2}\right]\left[b_{j} c_{j} x_{j}^{c_{j}-1}\right]^{2}\right. \\
& \left.\cdot\left[b_{j+1} c_{j+1}\left(c_{j+1}-1\right) x_{j+1}^{c_{j+1}-2}\right] \ldots\left[b_{n} c_{n}\left(c_{n}-1\right) x_{n}^{c_{n}-2}\right]\right\} \\
= & -\left(F^{\prime}\right)^{n+1}\left(\prod_{k=1}^{n} b_{k} c_{k} x_{k}^{c_{k}-2}\right)\left(\sum_{j=1}^{n} b_{j}\left(c_{1}-1\right) \ldots\left(c_{j-1}-1\right) c_{j}\left(c_{1+1}-1\right) \ldots\left(c_{n}-1\right) x_{j}^{c_{j}}\right) .
\end{aligned}
$$

From the last equality, if $M(f)$ is a singular matrix then either at least one of the $c_{1}, \ldots, c_{n}$ is equal to zero or at least two of the $c_{1}, \ldots, c_{n}$ are equal to one.

The converse is easily verified.

## 4. Geometric Interpretations of Allen Determinants

Let $M^{n}$ be a hypersurface of a Euclidean space $\mathbb{E}^{n+1}$. For general references on the geometry of hypersurfaces see $[3,4]$.

The Gauss map $v: M^{n} \longrightarrow S^{n+1}$ maps $M^{n}$ to the unit hypersphere $S^{n}$ of $\mathbb{E}^{n+1}$. The differential $d v$ of the Gauss map $v$ is known as the shape operator or Weingarten map. Denote by $T_{p} M^{n}$ the tangent space of $M^{n}$ at the point $p \in M^{n}$. Then, for $v, w \in T_{p} M^{n}$, the shape operator $A_{p}$ at the point $p \in M^{n}$ is defined by

$$
g\left(A_{p}(v), w\right)=g(d v(v), w)
$$

where $g$ is the induced metric tensor on $M^{n}$ from the Euclidean metric on $\mathbb{E}^{n+1}$.
The determinant of the shape operator $A_{p}$ is called the Gauss-Kronocker curvature.
Let $(N, g)$ be a Riemannian manifold. For more detailed properties of geometric structures on Riemannian manifolds, see [12]. A Riemannian connection, also called Levi-Civita connection, on the Riemannian manifold $(N, g)$ is an affine connection which is compatible with metric, i.e, $\nabla g=0$ and symmetric, i.e, $\nabla_{X} Y-\nabla_{Y} X=[X, Y]$, for any vector fields $X$ and $Y$ on $N$, where [,] is the Lie bracket.

The Riemannian curvature tensor $R$ is given in terms of $\nabla$ by

$$
R(X, Y) Z=\nabla_{X} \nabla_{Y} Z-\nabla_{Y} \nabla_{X} Z-\nabla_{[X, Y]} Z .
$$

A Riemannian manifold is called a flat space if its Riemannian curvature tensor vanishes identically.
Let $\sigma$ be a two dimensional subspace of the tangent space $T_{p} N$ and let $u, v \in \sigma$ be two linearly independent vectors such that $\sigma=S p(u, v)$. Then the sectional curvature of $\sigma$ at the point $p \in N$ is a real number defined by

$$
K(u, v)=K(\sigma)=\frac{g(R(u, v) v, u)}{g(u, u) g(v, v)-g(u, v)^{2}} .
$$

The Riccitensor of a Riemannian manifold $N$ at a point $p \in N$ is defined to be the trace of the linear map $T_{p} N \longrightarrow T_{p} N$ given by

$$
w \longmapsto R(w, u) v
$$

A Riemannian manifold is called Ricci-flat if its Ricci tensor vanishes identically.
The following result is well-known from [4,7].

Proposition 4.1. For the production hypersurface of $\mathbb{E}^{n+1}$ defined by

$$
L(\mathbf{x})=\left(x_{1}, \ldots, x_{n}, f\left(x_{1}, \ldots, x_{n}\right)\right),
$$

we have:
(i) The Gauss-Kronecker curvature $G$ is

$$
G=\frac{\operatorname{det}\left(f_{i j}\right)}{w^{n+2}}
$$

with $w=\sqrt{1+\sum_{i=1}^{n} f_{i}^{2}}$.
(ii) The sectional curvature $K_{i j}$ of the plane section spanned by $\frac{\partial}{\partial x_{i}}, \frac{\partial}{\partial x_{j}}$ is given by

$$
K_{i j}=\frac{f_{i i} f_{j j}-f_{i j}^{2}}{w^{2}\left(1+f_{i}^{2}+f_{j}^{2}\right)}
$$

(iii) The Riemannian curvature tensor $R$ and the metric tensor $g$ satisfy

$$
\begin{equation*}
g\left(R\left(\frac{\partial}{\partial x_{i}}, \frac{\partial}{\partial x_{j}}\right) \frac{\partial}{\partial x_{k}}, \frac{\partial}{\partial x_{l}}\right)=\frac{f_{i l} f_{j k}-f_{i k} f_{j l}}{w^{4}} . \tag{4.1}
\end{equation*}
$$

Corollary 4.2. The Allen's matrix of a twice differentiable quasi-sum production function with more than two variables is singular if its production hypersurface is a flat space.

Proof. Let $f=F\left(h_{1}\left(x_{1}\right)+\ldots+h_{n}\left(x_{n}\right)\right)$ be a twice differentiable quasi-sum production function, $n \geq 3$. If the production hypersurface of $f$ is a flat space then, by Theorem 4.1 of [7], $f$ is quasi-linear, namely at most one of $F, h_{1}, \ldots, h_{n}$ is a nonlinear function. This is a special case of statement (i) of Theorem 2.2. Therefore, we obtain that the Allen's matrix of $f$ is singular.

Corollary 4.3. Let $f=F\left(h_{1}\left(x_{1}\right)+\ldots+h_{n}\left(x_{n}\right)\right)$ be a twice differentiable quasi-sum production function with one of the $h_{1}, \ldots, h_{n}$ linear function and $F^{\prime \prime} \neq 0$. Then the production hypersurface of $f$ has vanishing Gauss-Kronocker curvature if and only if the Allen's matrix of $f$ is singular.

Proof. Let us assume that the production hypersurface of $f$ has vanishing Gauss-Kronocker curvature. Then, by Theorem 5.1 of [7], $f$ is of the form:

$$
\begin{equation*}
f=F\left(c_{1} x_{1}+c_{2} x_{2}+\sum_{i=3}^{n} h_{i}\left(x_{i}\right)\right) \tag{4.2}
\end{equation*}
$$

where $c_{1}, c_{2}$ are nonzero constants and $F, h_{3}, \ldots, h_{n}$ are strict monotone functions. It means from Theorem 2.2 that the Allen's matrix of $f$ is singular.

Conversely, under the hypothesis of the corollary, if the Allen's matrix of $f$ is singular, then, by Theorem $2.2, f$ is of the form (4.2). Therefore, by Theorem 5.1 of [7], we obtain that the production hypersurface of $f$ has vanishing Gauss-Kronocker curvature.

Theorem 4.4. Let $f\left(x_{1}, x_{2}, x_{3}\right)$ be a twice differentiable production function of 3 variables. If the production hypersurface of $f$ in $\mathbb{E}^{4}$ is a flat space then its Allen's matrix $M(f)$ is singular.

Proof. The Allen's matrix for the production function $f\left(x_{1}, x_{2}, x_{3}\right)$ is given by

$$
M(f)=\left(\begin{array}{cccc}
0 & f_{1} & f_{2} & f_{3}  \tag{4.3}\\
f_{1} & f_{11} & f_{12} & f_{13} \\
f_{2} & f_{21} & f_{22} & f_{23} \\
f_{3} & f_{31} & f_{32} & f_{33}
\end{array}\right)
$$

For the above matrix we find

$$
\begin{align*}
\operatorname{det}(M(f)) & =-f_{1}^{2}\left(f_{22} f_{33}-f_{23}^{2}\right)-f_{2}^{2}\left(f_{11} f_{33}-f_{13}^{2}\right)-f_{3}^{2}\left(f_{11} f_{22}-f_{12}^{2}\right)  \tag{4.4}\\
& +2 f_{1} f_{2}\left(f_{12} f_{33}-f_{13} f_{23}\right)-2 f_{1} f_{3}\left(f_{12} f_{23}-f_{13} f_{22}\right)+2 f_{2} f_{3}\left(f_{11} f_{23}-f_{13} f_{12}\right) .
\end{align*}
$$

On the other hand, if the production hypersurface of $f$ is a flat space, then, by the statement (iii) of Proposition 4.1, we have

$$
\begin{equation*}
f_{k n} f_{m l}=f_{k l} f_{m n} \tag{4.5}
\end{equation*}
$$

i.e. all brackets in the formula (4.4) are zero. From (4.4) and (4.5) we obtain $\operatorname{det}(M(f))=0$, which completes the proof.

Remark 4.5. The Theorem 4.4 also holds in case the production hypersurface of $f$ in $\mathbb{E}^{4}$ is a Ricci-flat space or has vanishing sectional curvature function.
